READ THESE INSTRUCTIONS FIRST

Write your index number, class and name on all the work you hand in.
Write in dark blue or black pen.
Do not use staples, paper clips, highlighters, glue or correction fluid.

Section A
There are ten questions. Answer all questions. For each question there are four possible answers A, B, C, and D.
Choose the one you consider correct and record your choice in soft pencil on the separate answer sheet.
Each correct answer will score one mark. A mark will not be deducted for a wrong answer.

Section B
Answer all questions in the spaces provided.

The number of marks is given in brackets [ ] at the end of each question or part question.
Show all your working on the same page as the rest of the answer.
Omission of essential working will result in loss of marks.
Electronic calculator may be used in this paper.
The total of the marks for this paper is 40.

A copy of the Periodic Table is printed on page 14.
Section A (10 marks)
Answer all questions.

1 Silica gel can be used to limit the growth of mould on leather goods and electronic equipment by absorbing water vapour from the air. Which of the following methods can be used to study the rate of absorption of water vapour in silica gel in 15 minutes?

A

<Diagram of A>

B

<Diagram of B>

C

<Diagram of C>

D

<Diagram of D>
2 An element is found to have the following properties:
- good electrical conductivity,
- shiny in appearance,
- solid at room temperature.
What is the element most likely to be?

A aluminium
B carbon
C nitrogen
D silicon

3 Urea is a compound with the chemical formula, CO(NH₂)₂.
Which of the following shows the correct information about one molecule of urea?

<table>
<thead>
<tr>
<th>number of elements</th>
<th>number of atoms</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>3</td>
</tr>
<tr>
<td>B</td>
<td>3</td>
</tr>
<tr>
<td>C</td>
<td>4</td>
</tr>
<tr>
<td>D</td>
<td>4</td>
</tr>
</tbody>
</table>

4 A mixture of hexane (boiling point, 70°C) and heptane (boiling point, 98°C) was separated by fractional distillation.
When the thermometer shows 70°C, at which point will there be the highest proportion of hexane?
5 Octane and water are immiscible liquids. Which method could be used to separate a mixture of octane and water and how is the purity of separated octane checked?

<table>
<thead>
<tr>
<th>method of separation</th>
<th>purity check</th>
</tr>
</thead>
<tbody>
<tr>
<td>A filtration</td>
<td>find the boiling point</td>
</tr>
<tr>
<td>B filtration</td>
<td>obtain a chromatogram</td>
</tr>
<tr>
<td>C using separating funnel</td>
<td>find the boiling point</td>
</tr>
<tr>
<td>D using separating funnel</td>
<td>obtain a chromatogram</td>
</tr>
</tbody>
</table>

6 Which of the following remains constant when a liquid undergoes freezing?

A energy level of particles  
B size of particles  
C distance between particles  
D attractive forces between particles

7 Which of the following best represents the change in arrangement of the particles when ammonium chloride undergoes heating?

A  
B  
C  
D

8 Isotopes of the same element contain

A equal numbers of electrons, protons and neutrons.  
B different numbers of electrons, protons and neutrons.  
C the same numbers of protons and electrons but a different number of neutrons.  
D the same numbers of electrons and neutrons but a different number of protons.
9 Which of the following diagrams represents molecules of methane?

A

B

C

D

10 Which of the following sub-atomic particles determines the chemical properties of an atom?

A proton
B neutron
C electron
D nucleus
1. The diagram shows the apparatus setup by a student to find the boiling point of ethanol.

Identify a mistake in the setup. Explain your answer and state how you can modify the setup to correct the mistake.

*mistake*..............................................................................................................

*explanation*............................................................................................................

............................................................................................................................

*modification*..........................................................................................................

............................................................................................................................ [2]
2 Information about four substances, P, Q, R and S is given below.

Substance P: It is a white solid. Only some parts dissolve in an excess of water.
Substance Q: It is a white solid formed by burning magnesium in oxygen.
Substance R: It is a grey solid which cannot be decomposed into anything simpler.
Substance S: It is a blue liquid. When it is distilled, a colourless liquid is collected.

(a) Classify each of the substances as either an element, a compound or a mixture. Complete the table below by placing a tick (✓) in the correct box in each row.

<table>
<thead>
<tr>
<th>substance</th>
<th>element</th>
<th>compound</th>
<th>mixture</th>
</tr>
</thead>
<tbody>
<tr>
<td>P</td>
<td>✔</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Q</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>R</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>S</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(b) State two differences in properties between substances P and Q.

difference 1…………………………………………………………………………………………………………………

difference 2…………………………………………………………………………………………………………………

[4] [2]
3. The solubility of three solids, P and Q, are shown in the table below.

<table>
<thead>
<tr>
<th>solid</th>
<th>solubility</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>solvent P</td>
</tr>
<tr>
<td>sand</td>
<td>insoluble</td>
</tr>
<tr>
<td>sulfur</td>
<td>soluble</td>
</tr>
<tr>
<td>salt</td>
<td>insoluble</td>
</tr>
</tbody>
</table>

You have a mixture of sand, sulfur and salt. Describe the steps you would carry out to obtain dry sample of each solid from the mixture.
4. Upon reaching home from school, a student realised that someone is baking in the kitchen even though she was just at the doorstep.

(a) Explain the student’s observation.

..............................................................................................................................................
..............................................................................................................................................
.............................................................................................................................................. [2]

(b) The student walked to the kitchen and saw her mother heating some chocolate in a pan and there is a bar of chocolate on the table. The diagram below shows what the student saw.

![Diagram showing chocolate being heated in a pan]

Complete the table below about the characteristics of particles in W and X.

<table>
<thead>
<tr>
<th></th>
<th>W</th>
<th>X</th>
</tr>
</thead>
<tbody>
<tr>
<td>arrangement</td>
<td></td>
<td></td>
</tr>
<tr>
<td>movement</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

[2]
(c) The student helps her mother by putting some of the ingredients back in the refrigerator. While doing so, she found a crushed empty plastic bottle in the refrigerator, which was still capped at its opening. She placed the crushed bottle on the kitchen table and the diagram below shows her observation after some time.

(i) Using Kinetic Particle Theory, explain her observation.

(ii) Explain why there was no change in the mass of the bottle and its content.
The table below shows some information about the atoms of elements, Q and R. The letters do not represent the chemical symbols of the elements.

<table>
<thead>
<tr>
<th>element</th>
<th>atomic number</th>
<th>number of neutrons</th>
<th>mass number</th>
</tr>
</thead>
<tbody>
<tr>
<td>Q</td>
<td>7</td>
<td></td>
<td>14</td>
</tr>
<tr>
<td>R</td>
<td>14</td>
<td>14</td>
<td></td>
</tr>
</tbody>
</table>

(a) (i) Complete the table above.
(ii) Draw the full electronic structure of R in the space below.

(b) Explain why the mass number of an atom does not include the number of electrons.

(c) Atoms of element Q can form diatomic molecules. What is a diatomic molecule?
(d) Both elements Q and R can react with hydrogen to form QH₃ and RH₄. State a similarity and a difference between molecules of QH₃ and RH₄.

similarity: .................................................................

.................................................................

.................................................................

difference: ..........................................................

.................................................................

.................................................................

.................................................................

[2]
6 A student found a bottle of an unknown substance in the lab. She realised that the label has fallen off. She found the following information on the bottle.

information:
- melting point = 650°C
- boiling point: 1107°C
- element found in Group II, Period 3

(a) Based on the information above, write the chemical symbol, with proton and nucleon numbers, of the unknown substance in the box below.

[2]

(b) The student did some research online and learnt that atoms of the unknown substance can form ions by losing 2 electrons.

(i) Suggest the charge of the ion formed.

(ii) Explain your answer in (b)(i).

[2]

draw 2.8.4, with R or Si written in the center

Electrons have negligible mass compared to protons and neutrons.

A molecule made up of two atoms chemically combined.

Similarities
- Both QH₃ and RH₄ contain hydrogen atoms.
- Both contain two different types of atoms.

Differences
- QH₃ contains 3 hydrogen atoms while RH₄ contains 4 hydrogen atoms.
- QH₃ contains atoms of Q and hydrogen while RH₄ contains atoms of R and hydrogens.
- QH₃ is made up of 4 atoms in total but RH₄ is made up of 5 atoms.

Additional Materials: Multiple Choice Answer Sheet

READ THESE INSTRUCTIONS FIRST

Write your index number, class and name on all the work you hand in.
Write in dark blue or black pen on both sides of the paper.
Working in pencil will not be marked.
You may use an HB pencil for any diagrams or graphs.
Do not use staples, paper clips highlighters, glue or correction fluid.

Section A
Answer all questions. For each question there are four possible answers A, B, C and D.
Choose the one you consider correct and record your choice in soft pencil in the multiple choice answer sheet.

Section B
Answer all questions. Write your answers in the spaces provided on the question paper.

FOR EXAMINER’S USE

Total 40

This document consists of 10 printed pages.

2
Section A (10 marks)
Answer all the questions.

1 Which of the following have both cytoplasm and chloroplasts?
   A root hair cells
   B xylem vessels
   C red blood cells
   D mesophyll cells

2 Red blood cells have a relatively large surface area.
   How does this help the red blood cell carry out its function?
   A It can contain more haemoglobin.
   B It can absorb oxygen at a faster rate.
   C It can move more quickly through the blood.
   D It can pass through narrow blood vessels easily.

3 The pancreas is a human organ that secretes proteins involved in digestion.
   Which of the following organelles is not likely to make up a large part of a pancreatic cell?
   A golgi apparatus
   B ribosomes
   C rough endoplasmic reticulum
   D smooth endoplasmic reticulum
4 Which of the following best describes the process of diffusion?

<table>
<thead>
<tr>
<th>type of molecules</th>
<th>direction of movement</th>
<th>presence of partially permeable membrane</th>
</tr>
</thead>
<tbody>
<tr>
<td>A solute</td>
<td>high to low solute concentration</td>
<td>no</td>
</tr>
<tr>
<td>B solute</td>
<td>low to high solute concentration</td>

</tr>
<tr>
<td>C water</td>
<td>high to low water potential</td>
<td>no</td>
</tr>
<tr>
<td>D water</td>
<td>low to high water potential</td>
<td>yes</td>
</tr>
</tbody>
</table>

5 The diagram shows the results of an experiment, where two plant cells were placed in solutions X and Y respectively for 30 minutes.

![solution X](image1)
![solution Y](image2)

Which process took place in the experiment and what was the relative water potentials of solutions X and Y?

<table>
<thead>
<tr>
<th>process</th>
<th>water potential</th>
</tr>
</thead>
<tbody>
<tr>
<td>A osmosis</td>
<td>solution X has higher water potential than solution Y</td>
</tr>
<tr>
<td>B diffusion</td>
<td>solution X has lower water potential than solution Y</td>
</tr>
<tr>
<td>C osmosis</td>
<td>solution X has lower water potential than solution Y</td>
</tr>
<tr>
<td>D diffusion</td>
<td>solution X has higher water potential than solution Y</td>
</tr>
</tbody>
</table>
6 Which processes can take place in a muscle cell when oxygen is not available?

I osmosis  
II diffusion  
III active transport  
IV aerobic respiration

A I and II only  
B III and IV only  
C I, II and IV only  
D II, III and IV only

7 A human red blood cell is placed in hypotonic solution. What is the net movement of the water molecules and the effect on the cell?

<table>
<thead>
<tr>
<th>net movement of water</th>
<th>effect on cell</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>

8 The diagram shows a section of a leaf of a green plant. During exposure to bright light, which cell contains the most starch?

![Diagram of a leaf section]

Sec1 Exp Bio SA2 2016
9 The graph below shows the amount of oxygen produced by a green plant over a 24-hour period, on a warm, sunny day. Which letter represents a point in the day where light intensity is the highest?

![Graph showing amount of oxygen produced per hour over time with points A, B, C, D labeled.]

10 The diagram below shows a leaf.

![Diagram of a leaf with a line labeled X.]

Which of the following statements explains how feature X helps the leaf to optimise its function?

A ensures that carbon dioxide rapidly reaches the inner cells of the leaf
B carries manufactured food away from lamina to other cells of the plant
C increases surface area to volume ratio to maximise light absorption
D holds the leaf lamina away from the stem so that it receives optimum light

Sec1 Exp Bio SA2 2016

(SECONDARY 1)

LOWER SECONDARY SCIENCE
PAPER 1

5 October 2016
45 minutes
(1100 – 1145 hrs)

Additional Materials: NIL

READ THESE INSTRUCTIONS FIRST

1. Answer all the questions in the spaces provided on the question paper.

2. Write in dark blue or black pen. You may use a soft pencil for any diagrams, graphs or rough working.

3. Use pi (π) value preprogrammed in calculator.

4. Express your final answer in 3 significant figures where appropriate, show all working, and include units in all your working.

5. Do not use staples, paper clips, highlighters, glue or correction fluid/tape.
Section A (30 marks)
There are 30 multiple-choice questions in this section. For every question, select the most suitable option and shade in the appropriate circle in the OTAS provided.

1. What is the length of the nail as shown below?

   ![Ruler](image)

   A  2.9 cm  B  3.0 cm  C  5.2 cm  D  8.1 cm

2. The figure below shows an electrical wire placed between the jaws of a pair of vernier callipers.

   ![Vernier Calliper](image)

   The radius of the electrical wire is _______ cm.

   A  0.49  B  0.54  C  0.97  D  1.07

3. A plant specimen is viewed under the microscope installed with an eyepiece of magnification 10x and objective lens of magnification 25x.

   When viewed under the microscope, the specimen has a length of 60 mm. What is the actual length of the specimen?

   A  0.24 mm  B  1.7 mm  C  2.4 mm  D  6.0 mm
4. Sarah has been asked to calculate the volume of a piece of wire, which is about 0.17 cm in diameter and about 0.700 m long. Which are the most suitable measuring instruments she should use?

<table>
<thead>
<tr>
<th>Length</th>
<th>Diameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Metre rule</td>
</tr>
<tr>
<td>B</td>
<td>Vernier callipers</td>
</tr>
<tr>
<td>C</td>
<td>Measuring tape</td>
</tr>
<tr>
<td>D</td>
<td>Metre rule</td>
</tr>
<tr>
<td></td>
<td>Measuring tape</td>
</tr>
</tbody>
</table>

5. Timothy placed a sample of an unknown solid in liquids of different densities. The table below shows the results of his observations.

<table>
<thead>
<tr>
<th>Liquid</th>
<th>Density of liquid (kg/m³)</th>
<th>Observation</th>
</tr>
</thead>
<tbody>
<tr>
<td>V</td>
<td>1000</td>
<td>Floats</td>

<tr>
<td>W</td>
<td>12 300</td>
<td>Floats</td>
</tr>
<tr>
<td>X</td>
<td>700</td>
<td>Sinks</td>
</tr>
<tr>
<td>Y</td>
<td>450</td>
<td>Sinks</td>
</tr>
</tbody>
</table>

What is the approximate density of the sample?

A 700 kg/m³
B 1000 kg/m³
C Between 700 kg/m³ and 1000 kg/m³
D Between 1000 kg/m³ and 12 300 kg/m³

6. On Earth, the gravitational field strength is about 10 N/kg. On Mars, the gravitational field strength is about 3.7 N/kg.

If an object has a weight of 50 N on Earth, what is its weight on Mars?

A 1.4 N  B 5.0 N  C 18.5 N  D 135 N

7. Two forces 5 N and 7 N are acting on an object. Which one of the following is not a possible resultant force acting on the object?

A 2 N  B 6 N  C 10 N  D 14 N
8. If metal X scratches metal Y and a scratch mark is left on metal Y, a tick (✓) is put in the box. Otherwise, a cross (✗) is put in the box.

<table>
<thead>
<tr>
<th></th>

</tr>
<tr>
<td>titanium</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
<td>✗</td>
</tr>
</tbody>
</table>

Which one of the following correctly shows the metals arranged in increasing hardness?

A. brass, gold, steel, titanium
B. gold, brass, steel, titanium
C. steel, titanium, brass, gold
D. titanium, steel, brass, gold

9. Which of the following statements about diffusion is correct?

A. Diffusion can only take place in gases and liquids.
B. Diffusion shows that all particles are made up of molecules.
C. The greater the mass of the particle, the slower the rate of diffusion.
D. The speed of diffusion is not affected by temperature.

10. Which of the following statements about a compound is false?

A. A compound has a fixed melting point.
B. A compound is made up of at least 2 different types of atoms.
C. A compound has properties that are different from that of its constituent elements.
D. A compound can be separated into its constituent elements by separating techniques such as filtration, distillation, etc.

11. Which of the following ways can be used to distinguish between pure water and seawater?

I. Adding sodium chloride (table salt)
II. Adding distilled water
III. Checking the boiling point
IV. Using filtration

A. I only
B. III only
C. I, III and IV only
D. II, III and IV only
12. Which of the following diagrams describe a mixture of water vapour and chlorine gas?

A  

B  

C  

D  

13. Which of the following substances A, B, C or D (at room temperature) will contain particles that vibrate about fixed positions?

<table>
<thead>
<tr>
<th>Substance</th>
<th>Melting point ºC</th>
<th>Boiling point ºC</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>-28</td>
<td>67</td>
</tr>
<tr>
<td>B</td>
<td>11</td>
<td>52</td>
</tr>
<tr>
<td>C</td>
<td>90</td>
<td>850</td>
</tr>
<tr>
<td>D</td>
<td>-101</td>
<td>-35</td>
</tr>
</tbody>
</table>

14. Which of the following mixtures can filtration be used to obtain the underlined substance?

A  Iron filings and sand  
B  Copper and carbon dioxide  
C  Salt and sugar  
D  Oil and sand

15. Which of the following compounds contain exactly three elements?

A  Potassium oxide  
B  Lead chloride  
C  Sodium hydroxide  
D  Carbon dioxide
16. A solid is thought to be pure iron fillings. Which of the following is the best way to test its purity?
   A. Measure its melting point.
   B. Pass a magnet over the solid and test whether it is attracted.
   C. React it with dilute hydrochloric acid.
   D. React it with aqueous sodium hydroxide.

17. A flask contains the liquids chloroform and water. They are separated using a separating funnel. Which conclusion can be made from this observation alone?
   A. Chloroform is very poisonous and must be handled carefully.
   B. Chloroform and water have different boiling points.
   C. Chloroform and water are immiscible liquids.
   D. Chloroform has a higher density than water.

18. A filter tip of a cigarette acts as both a filter and a condenser. Which of the following cannot be removed, assuming that the filter tip is 100% effective? (Provide a table with data)

<table>
<thead>
<tr>
<th>Substance</th>
<th>Boiling point  °C</th>
</tr>
</thead>
<tbody>
<tr>
<td>A. Carbon Monoxide</td>
<td>−191</td>
</tr>
<tr>
<td>B. Water</td>
<td>100</td>
</tr>
<tr>
<td>C. Nicotine</td>
<td>247</td>
</tr>
<tr>
<td>D. Tar</td>
<td>350 to 400</td>
</tr>
</tbody>
</table>

19. Which of the following is an inference and not an observation?
   A. Water evaporates quicker at higher temperatures
   B. All matter is made up of tiny particles.
   C. Dogs and cats are both covered in fur.
   D. Water drains quicker in sandy soil than clay soil.

20. Which of the apparatus below is most suitable for measuring exactly 28.7 cm³ of a liquid?
   A. Burette
   B. Displacement can
   C. Measuring cylinder
   D. Electronic balance
21. The table shows some characteristics of four types of cells. Which cell could be a red blood cell? Key: \( \checkmark = \text{present} \quad \times = \text{absent} \)

<table>
<thead>
<tr>
<th></th>
<th>Nucleus</th>
<th>Chloroplast</th>

25. The diagram shows a root hair cell, surrounded by a dilute solution of mineral ions.

Which statement is correct?

A. Water molecules move into the root hair because the water potential is lower outside.
B. Water molecules move into the root hair because the water potential is higher outside.
C. Water molecules move out of the root hair because the water potential is lower outside.
D. Water molecules move out of the root hair because the water potential is higher outside.
26. The apparatus was set up as shown in the diagram.

After 30 minutes, the partially permeable tubing containing liquid Y had collapsed while the tubing containing liquid Z was firm. Which could be a correct description of the liquids at the start of the experiment?

<table>
<thead>
<tr>
<th>Liquid X</th>

END OF YEAR EXAMINATION
(SECONDARY 1)

LOWER SECONDARY SCIENCE
PAPER 2

5 October 2016
1 hour 45 minutes

Additional Materials: NIL

READ THESE INSTRUCTIONS FIRST

1. Answer all the questions in the spaces provided on the question paper.

2. Write in dark blue or black pen. You may use a soft pencil for any diagrams, graphs or rough working.

3. Use pi (π) value preprogrammed in calculator.

4. Express your final answer in 3 significant figures where appropriate, show all working, and include units in all your working.

5. Do not use staples, paper clips, highlighters, glue or correction fluid/tape.

6. A copy of the Periodic Table is found overleaf.

This document consists of 18 printed pages.
Section A (40 marks)

Answer all questions in the spaces provided.

A1 Fig. 1.1 shows the setup of a pendulum experiment, while Fig. 1.2 shows the angle of release. The experiment was performed four times, each with a different length (L).

![Diagram of pendulum setup]

The following results are obtained and tabulated below.

<table>
<thead>
<tr>
<th>Experiment</th>
<th>Length L/m</th>
<th>Period T/s</th>
<th>Mass of bob M/kg</th>
<th>Angle of release θ/°</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>0.10</td>
<td>0.638</td>
<td>0.250</td>
<td>10.0</td>
</tr>
<tr>

</tr>
<tr>
<td>4</td>
<td>0.25</td>
<td>1.003</td>
<td>0.250</td>
<td>10.0</td>
</tr>
</tbody>
</table>

Period is the time taken for one complete oscillation. The same type of thread is used for the experiments.

(a) Suggest a possible hypothesis for the experiment. [2]

..............................................................................................................................................................................
..............................................................................................................................................................................

(b) Identify the following variables for this experiment:

(i) Independent variable ................................................................. [1]

(ii) Dependent variable ................................................................. [1]

(iii) Controlled variables (list two) ................................................. [2]

..............................................................................................................................................................................
..............................................................................................................................................................................
A2 (a) Fig. 2.1 shows how the volume of 10 g of water changes as the temperature rises from -10 °C to +10 °C. The water melts at 0 °C.

![Graph showing volume change with temperature](image)

Fig. 2.1

Calculate the density of unmelted ice at 0 °C.

Density = .............................. \[1\]

(b) State how the density of water changes as the temperature rises from -10 °C to +10 °C.

You should refer to the density changes, if any, when water is in solid state, as it is melting and when it is in liquid state. No further calculation is necessary. \[2\]

-10 °C to 0 °C: ........................................................................................................

Melting at 0 °C: ........................................................................................................

0 °C to 4 °C: ........................................................................................................

4 °C to +10 °C: ........................................................................................................
(c) The Plimsoll line is a reference mark located on the external surface of a ship's hull. This indicates the maximum depth to which the ship may be safely immersed when loaded with cargo. Hence when a merchant ship is loaded in a port, it should not be allowed to sink below the level marked on the Plimsoll line.

Fig. 2.2 shows the safe load levels indicated on the side of a ship.

![Diagram of a ship with load lines](image)

**Fig. 2.2**

(i) Why is the safety load line higher in freshwater? 

(ii) Why does a ship float higher in winter than in summer?

A3 (a) Fig. 3.1 shows the side view of a dam used to store water.

![Diagram of a dam](image)

**Fig. 3.1**
Explain briefly, in terms of pressure, why the thickness of the wall of the dam is greater at the base than at the top.

(b) Fig. 3.2 shows a simple type of hydraulic braking systems used in a light vehicle.

![Diagram of hydraulic braking system]

Fig. 3.2

The cross-sectional areas of the small cylinder and large cylinder are 0.0004 m\(^2\) and 0.0024 m\(^2\) respectively.

(i) The brake pedal is pushed against the piston in the small cylinder with a force of 90 N. Calculate the pressure exerted on the brake fluid in the small cylinder.

\[
\text{Pressure} = \text{...} \quad [1]
\]

(ii) State the amount of pressure exerted by the brake fluid on the piston in the large cylinder.

\[\text{...} \quad [1]\]
(iii) Determine the force exerted by the brake fluid on the piston in the large cylinder.

Force = ......................  [1]

A4 The diagram shows some reactions of magnesium.

(a) A mixture of magnesium and oxygen, when not ignited, remains unchanged as a mixture of magnesium and oxygen. When ignited, the magnesium burns with a blinding white light.

State two reasons why the magnesium oxide formed is a compound and not a mixture.  [2]

(b) Name the Process B to obtain solid pure magnesium sulfate from magnesium sulfate solution.  [1]
(c) Write down the chemical symbols for all the elements present in magnesium sulfate.

(d) A sample of magnesium was found to be contaminated with iron fillings and sodium chloride solution. Select (by circling) suitable techniques to obtain pure magnesium.

Step 1: distillation / separating funnel / filtration

Step 2: crystallization / magnetic attraction / evaporation to dryness

(e) A bottle of concentrated sulfuric acid was accidentally spilled in the laboratory. Fumes of sulfuric acid are choking and pupils present in the laboratory must be quickly evacuated for safety reasons.

(i) State and define the process in which fumes of sulfuric acid spreads from the area of spillage to the rest of the laboratory.

(ii) State a factor that can cause the process stated in (i) above to occur in a shorter period of time.
A5 You are given different sets of three substances each. In each set, circle the odd one out and provide a reason for your answer.

(a) Sodium / lead / sulfur (circle odd one out) [2]

Reason:

(b) Air / brass / water (circle odd one out) [2]

Reason:

A6 (a) Write down what the acronym DNA stands for. [1]

(b) Outline the relationship between DNA, genes and chromosomes. [2]
In an investigation, the volume of samples of 20 dried raisins was measured. Each sample was then placed in water or sugar solutions of different concentrations. After 12 hours, the raisins were blotted dry and the volume of each sample of raisins was measured again. Fig. 7 shows the results.

![Graph showing volume change over percentage sugar concentration](image)

Fig. 7

(a) Calculate the percentage change in the volume of the sample of raisins in 5% sugar solution.

Percentage change = .................................. [2]

(b) Explain the results in the 10% sugar solution.  ..........................................................  [2]
The rate of photosynthesis in six tropical crop plants was measured when the plants were growing outside under normal conditions (rate X). The measurements were repeated when the plants were grown under controlled optimum conditions in a glasshouse (rate Y). The results are shown in the table and bar chart below.

<table>
<thead>

\[
\text{difference (Y-X) in the rate of photosynthesis/\( \mu \text{mol/m}^2/\text{s} \)}
\]

(a) Which two crops show the greatest difference between the rate of photosynthesis?
(b) The measurements of the rate of photosynthesis (X) of the plants are means of 10 readings. Suggest a reason why mean measurements were used. 

(c) Suggest two factors that were changed when the plants were grown in controlled optimum conditions.

Section B (30 marks)

Answer all questions in the spaces provided.

B1 Study the flowchart given and answer the following questions.

```
Lead(II) nitrate solution + dilute hydrochloric acid
```

```
Suspension of white precipitate A + water
```

```
Add oil
```

```
Mixture B
```

(a) State whether the reaction between lead(II) nitrate and hydrochloric acid is a physical or chemical change. 

(b) State one physical property of A.
Mixture B, upon standing for several minutes, separate out into three layers. The top layer looks like oil while the bottom layer is a chalky white substance.

(c) Select, by circling, which of the following apparatus/technique can be used to check if mixture B is a solution or a suspension.

Separating funnel / distillation / filtration / crystallization

(d) Describe, in steps, how you would obtain a dry sample of substance A from mixture B.

(e) The melting point of nitrogen is −210 °C while its boiling point is −195 °C. Using one circle O to represent a diatomic molecule of nitrogen, draw some nitrogen molecules to show their arrangement at room temperature and pressure (25 °C, 1 atm).
(f) The element nitrogen is found in all nitrate salts, as in the case with lead(II) nitrate. Several types of nitrogen atoms (known as "isotopes") have been discovered, differing only in the number of neutrons. The two most common nitrogen atoms can be depicted as follows:

\[
\begin{array}{c}
14 & \text{N} \\
7 & \\
15 & \text{N} \\
7 & \\
\end{array}
\]

Using information about these two isotopes of nitrogen, complete the table below:

<table>
<thead>
<tr>

........................................................................................................................................................................
........................................................................................................................................................................
(ii) Increase in temperature of the air.

(b) Fig. B2 below shows a potometer.

![Diagram of a potometer](image)

**Fig. B2**

(i) Describe how you think the potometer can be used to measure the rate of water loss from the leafy shoot.

(*Hint: position of air bubble*)

(ii) Hence, describe how the leafy shoot absorbs more water.
(iii) The table shows the results of an investigation, using a potometer similar to that in (b), to measure the rate of water loss from a leafy shoot of a plant kept in different conditions.

<table>

<td>16</td>
</tr>
</tbody>
</table>

State and explain the effect of moving air on the water loss from the leafy shoot. [2]

B3 (a) The engine of a car exerts a forward, horizontal force of 15 000 N to cause it to move along a rough road. The car moves at a constant speed of 50 km/h.

(i) Complete the free body diagram of the car moving in the horizontal direction. Draw and label the horizontal forces acting on the car. [1]

(ii) State the amount of friction acting on the car. [1]

(iii) Suggest a modification that can be made to the car to reduce the amount of air resistance acting on it when it moves. [1]
When a head strikes another object, like the ground, two collisions occur. The first collision is between the skull and the ground, the second between the brain and the skull. It is important to wear a helmet in any activity with a risk of head collisions.

During a collision with a tree or the ground, a helmet crushes to absorb some of the impact of the collision. By slowing down over a longer period of time, the collision between the brain and the skull is reduced or avoided.

Fig. B3 shows modern cars designed to crumple on impact.

Use the information about helmets above, to explain why it is important for cars to be designed with crumple zones.
Fig. B4 shows the properties of some materials used in the manufacturing and building industries.

When choosing a material for a particular function or job, you need to consider the stiffness, strength and density of the material. You will also need to be aware of the cost involved too.

<table>

* These strengths are for the materials under compression.
1 tonne = 1000 kg.
GRP: Glass reinforced plastic
CFRP: Carbon fibre reinforced plastic

Fig. B4

(a) The relative stiffness and relative strengths of concrete, brick and wood are lower than the rest of the materials.

Why are they still often used for building houses?  

(b) (i) Explain what is meant by strength of a material.
(ii) Stiffness measures the rigidity of a material — the extent to which it resists deformation when a force is applied on it. The stiffer a material is, the less flexible it is. Explain the importance of calculating the ratios $\frac{\text{stiffness}}{\text{density}}$ and $\frac{\text{strength}}{\text{density}}$ of each material. [1]

(c) GRP can be used to build small boats and even small minesweepers for the Navy. A minesweeper is a small naval warship designed to remove threats posed by naval mines. This ensures that waterways are safe for ships to travel in.

With the help of Fig. B4, suggest

(i) Why is it useful to make minesweepers from GRP? [1]

(ii) Why large naval ships, used for warfare, should not be made from GRP. [1]

End of paper
SUGGESTED MARK SCHEME

Section A (40 marks)

1. (a) If the length of thread increases, then the time of one complete swing increases. 
   [2]
   1 mark: correctly identifies dependent (0.5 mark) and independent (0.5 mark) variables
   1 mark: hypothesis worded with directionality effect

   (b) (i) Length of thread 
   [1]
   (ii) Period 
   [1]
   (iii) mass of bob, angle of release, type of thread 
   [any two answers, 1/2 mark for each answer] 

2. (a) Density = mass / volume 
   = \frac{10}{11} 
   = 0.909 \text{ g/cm}^3 
   [\frac{3}{4}]

   (b) -10 °C to 0 °C: density of water remains constant at about 0.91 g/cm².
   Melting at 0 °C: density increases to 1 g/cm³.
   0 °C to 4 °C: density increases further to a maximum of 1.04 g/cm³.
   4 °C to +10 °C: density decreases to 1 g/cm³. 
   [\frac{3}{4}]

   (c) (i) Freshwater is less dense. 
   With the same amount of load, the ship will be floating higher. 
   [\frac{1}{4}]
   (ii) In winter, volume of water in the sea decreases. 
   This causes the density of the water to increase. 
   [\frac{1}{4}]

3. (a) As the depth of water increases, the water pressure exerted on the wall of the dam increases. 
   To prevent the wall from cracking, the wall is thicker at the base 
   [1]

   (b) Deduct ½ mark if wrong units or no formula. 
   Award zero if no working shown.
   (i) Pressure = Force / Area 
   = \frac{90}{0.0004} 
   = 225 000 \text{ Pa} (accept N/m²) 
   [1]

   (ii) 225 000 Pa (accept N/m²) 
   [1]

   (iii) Force = Pressure \times Area 
   = 225 000 \times 0.0024 
   = 540 \text{ N} 
   [1]
4 (a) (1) It has a fixed melting / boiling point.
(2) It has properties different from its constituent elements.
   [any other reasons that is correct also can be accepted]  [2]
(b) crystallization  [1]
(c) Mg / S / O  [1]
(d) Step 1: filtration
   Step 2: magnetic attraction  [1]
(e) (i) Diffusion [1]
   The process by which particles move down the concentration gradient
   [0.5] until equilibrium is reached [0.5].  [1]
   (ii) Any: raise temperature / greater spillage / etc
   No mark if just state "temperature" / "spillage" i.e must include direction
   of change  [1]
5 (a) Circle: sulfur
   Reason: it is non-metal whereas the other 2 are metals  [1]
(b) Circle: water
   Reason: it is compound whereas the other 2 are mixtures  [1]
6 (a) Deoxyribonucleic acid  [1]
(b) A gene is a small section of DNA [1], located at a particular locus on a
   chromosome [1], which stores hereditary information.  [2]
7 (a) \[
\% \text{ change} = \left(\frac{12.8 - 8}{8}\right) \times 100\% = 60\%\]  [1]
(b) There is no change in the volume of the raisins. There is no net movement
   of water. [1]
   The water potential of the raisins is the same as that of the 10% sugar
   solution. [1]  [2]
8 (a) Cassava and eucalyptus  [1]
(b) To reduce random error / offset any anomaly in the readings, obtaining a
   more accurate result.  [1]
(c) Any 2 of the following:
   Temperature / amount of light / amount of carbon dioxide  [2]
Section B (30 marks)

1. (a) Physical change
   (b) Any logical answer eg: it is insoluble in water; it is insoluble in oil, etc.
   (c) Filtration
   (d) Step 1: Use a separating funnel to remove the oil layer (it remains in the separating funnel).
   Step 2: Filter the mixture obtained from step 1. The residue will be substance A.
   Step 3: Rinse residue A with distilled water and pat dry between pieces of filter paper.
   (e) [arrangement of particles in gaseous state]
   (f) Nitrogen-14: 7 protons, 7 electrons, 7 neutrons
       Nitrogen-15: 7 protons, 7 electrons, 8 neutrons
       [0.5 mark for each correct sub-atomic particle]

2. (a) Transpiration is the loss of water vapour through the aerial parts of the plant, mainly through the stomata in the leaves
   (b) (i) The leafy shoot loses water in the form of water vapour during transpiration and absorbs water to replace the water loss. The air bubble moves. [1] The distance moved by the air bubble (final position – initial position) can be used to measure the rate of water loss by considering the time taken.
   (ii) Loss of water vapour via the stomata [1] creates a suction force (transpiration pull) which draws water up the xylem vessels in the stem and roots. [1]
   (b) (i) Moving air results in more water loss from the leafy shoot as it removes the water vapour lost through stomata faster than still air. [1] The leafy shoot absorbs more water to replace the water lost and the bubble moves a longer distance. [1]
   (ii) High humidity means high amount of water vapour in the air. This decreases the water vapour concentration gradient between the air and inside the leaves. [1] The plant loses less water vapour via the stomata and the rate of transpiration is reduced. [1]
   (iii) A higher outside temperature means that the water vapour lost by the plant evaporates / diffuses faster. [1] There is a greater water vapour concentration gradient between the air and inside the leaves. The plant loses more water vapour faster and the rate of transpiration increases. [1]
3. (a) (i) 

\[ \text{car} \rightarrow \text{Forward horizontal force} \frac{1}{2} \]

Friction \[ \frac{1}{2} \]

(ii) 15 000 N

(iii) Adopt a more streamline shape for the car body.

(b) During a collision, the front and back parts of the car will crush / crumple to absorb some impact.

Slows down the collision over a longer time period.

This reduces the risk of the passengers getting severely / fatally injured.

4. (a) Cheap / the costs per tonne are the lowest.

(b) (i) Ability to withstand a heavy load without breaking.

(ii) Materials are being compared according to the same density base value [0.5]. Allows fair (or accurate) comparison to be made [0.5]

(c) (i) Less dense than metals. Cheaper than aluminium or steel.

(ii) \( \frac{\text{Stiffness}}{\text{Density}} \) value might not be high enough. [0.5]

Large naval ships can deform easily when a large force (e.g., due to bomb explosion) is exerted on them. [0.5]
