CHEMISTRY
PAPER 1 Multiple Choice

1. A bottle of solid magnesium oxide has been contaminated with sodium chloride crystals. How can a pure sample of magnesium oxide be obtained from this mixture?
   A. Add acid to the mixture, filter then evaporate the filtrate
   B. Add acid to the mixture, filter then collect the residue
   C. Add water to the mixture, filter then evaporate the filtrate
   D. Add water to the mixture, filter then collect the residue

2. Solid ammonium chloride decomposes on heating according to the following equation:
   \[ \text{NH}_4\text{Cl}(s) \rightarrow \text{NH}_3(g) + \text{HCl}(g) \]

   Which change would occur to the damp red litmus paper in the experiment above?
   A. It remains red
   B. It turns blue and is then bleached
   C. It turns blue and remains blue
   D. It turns blue and then turns red

3. Which ion has the least number of occupied shells?
   A. \( \text{Ca}^{2+} \)
   B. \( \text{N}^{3-} \)
   C. \( \text{Li}^{+} \)
   D. \( \text{Cl}^{-} \)

4. Which particles are responsible for conducting electricity in metals and for conducting electricity in molten ionic compounds?

<table>
<thead>
<tr>

</tbody>
</table>

This question paper consists of 14 printed pages.
5. The models and formulae for some molecules are shown below.

\[ XY_3 \quad \text{Z} \]

Which of the following is the correct model for a molecule of the compound formed between Y and Z?

A  
B  
C  
D  

6. The electrical properties of four substances W, X, Y and Z are shown below.

<table>
<thead>
<tr>
<th>Substance</th>
<th>Electrical Property</th>
</tr>
</thead>
<tbody>
<tr>
<td>W</td>
<td>Conducts electricity only in aqueous state</td>

</tbody>
</table>

7. Which solid does not contain covalent bonds?

A  Gold  
B  Graphite  
C  Ice  
D  Silicon dioxide

8. Which substance contains the greatest number of molecules in 1 g?

A  \( \text{O}_2 \)  
B  \( \text{NO}_2 \)  
C  \( \text{CO} \)  
D  \( \text{SO}_2 \)

9. Which one of the following has a mass equal to the mass of one mole of \( \text{H}_2\text{O} \)?

A  One molecule of water  
B  24 dm³ of water  
C  Two moles of \( \text{H}_2 \) and one mole of \( \text{O}_2 \)  
D  One mole of steam

10. 20 cm³ of oxygen reacts with 20 cm³ of carbon monoxide to form carbon dioxide. What is the volume of the gases remaining at the end of the reaction? All volume are measured at room temperature and pressure.

<table>

Part of the Periodic Table is shown below.
The letters are not the symbols of the elements.

Which statement about the elements is correct?

A. V is more reactive than X.
B. X has a lower melting point than V.
C. Y is in the same Group as X.
D. Z is more reactive than W.

The main reason farmers do not add calcium hydroxide and ammonium nitrate fertilizer to the soil at the same time is because:

A. the soil would become too alkaline.
B. the soil would become too acidic.
C. calcium hydroxide prevents the absorption of fertilizer.
D. the fertilizer would lose nitrogen in the form of ammonia gas.

The diagram shows two sets of reactions used to prepare lead(II) sulfate from lead(II) carbonate.

Which of the following is not a step in the preparation of lead(II) sulfate from lead(II) carbonate shown in the diagram?

A. Add lead(II) carbonate until no more gas is produced.
B. Filter off unreacted lead(II) carbonate.
C. Evaporate the filtrate until lead(II) nitrate crystallizes.
D. Collect lead(II) sulfate by filtration.

Germanium(V) oxide is an amphoteric oxide. Which substance A, B, C or D in the following table could be germanium(V) oxide?

<table>
<thead>
<tr>

In an accident at a factory, some hydrochloric acid was split on the floor.
Which substance, when added in excess would neutralise the acid without leaving an alkaline solution?

A. Calcium carbonate
B. Sodium hydroxide
C. Aqueous ammonia
D. Magnesium chloride

Which of the following salts gives only a low yield when it is made by reacting a metal oxide with dilute sulfuric acid?

A. Calcium sulfate
B. Iron(II) sulfate
C. Copper(II) sulfate
D. Zinc sulfate

The following sequence shows the steps in the conversion of calcium phosphate, \( \text{Ca}_8(\text{PO}_4)_2 \), to phosphorus acid, \( \text{H}_3\text{PO}_3 \).

\[ \text{Ca}_8(\text{PO}_4)_2 \rightarrow \text{P}_4 \rightarrow \text{P}_4\text{O}_{10} \rightarrow \text{H}_3\text{PO}_3 \]

The respective oxidation numbers of phosphorus in the above sequence are:

A. +5, 0, +3
B. +5, 0, +6
C. +2, +4, −4, +1
D. +1, +4, +3, +1

Sulfur dioxide reacts with aqueous bromine according to the following equation:

\[ \text{SO}_2(\text{aq}) + \text{Br}_2(\text{aq}) + 2\text{H}_2\text{O}(l) \rightarrow \text{H}_2\text{SO}_4(\text{aq}) + 2\text{HBr}(\text{aq}) \]

Which element has been oxidised?

A. bromine
B. oxygen
C. hydrogen
D. sulfur
21 Stainless steel is an alloy made up of iron with other elements such as nickel and chromium. The diagram below represents the particles in a certain grade of stainless steel.

Which of the following shows the composition (of the number of particles) of the stainless steel as shown in the diagram?

<table>

22 When gas Z is passed over heated copper(II) oxide, the products are copper and steam only. What is gas Z?

A Ammonia  
B Hydrogen  
C Carbon monoxide  
D Methane

23 Copper(II) carbonate, calcium carbonate and zinc carbonate decompose when heated. The temperature at which decomposition takes place depends upon the position of the metal in the reactivity series.

What is the correct order for their decomposition?

A Copper(II) carbonate       Zinc carbonate       Calcium carbonate  
B Calcium carbonate          Zinc carbonate         Copper(II) carbonate  
C Calcium carbonate          Copper(II) carbonate     Zinc carbonate  
D Zinc carbonate             Calcium carbonate         Copper(II) carbonate

24 What is the effect of a catalyst on the activation energy and enthalpy change of a reaction?

Which is the order of decreasing reducing power of the metals W, Y, and Z?

A Y > W > Z  
B Y > Z > W  
C Z > Y > W  
D W > Z > Y

26 In the Haber process, the synthesis of ammonia from hydrogen and nitrogen is a reversible reaction. The energy profile of the reaction with or without a catalyst is shown below.

Which of the following statements is correct when describing the energy changes involved in the reaction?

A The forward catalysed reaction is endothermic  
B (E₁ - E₃) is the enthalpy change of the forward reaction  
C E₁ is the activation energy for the backward catalysed reaction  
D E₂ is the enthalpy change of the backward catalysed reaction
27 The reaction between marble chips and 200 cm³ of 0.2 mol/dm³ hydrochloric acid (in excess) was studied by collecting the carbon dioxide gas released in a burette. The results are shown in the graph below.

<table>
<thead>
<tr>
<th>Maximum volume of CO₂ collected (cm³)</th>

<tr>
<td>D</td>
<td>2 V</td>
</tr>
</tbody>
</table>

How would the result change if the experiment is repeated by using same mass of marble chips and 200 cm³ of 0.4 mol/dm³ hydrochloric acid?

28 Which of the following electrolytes will increase in pH when electrolysed using platinum electrodes?

A. Aqueous copper(II) sulfate  
B. Concentrated sodium chloride solution  
C. Aqueous calcium nitrate solution  
D. Dilute nitric acid

29 A student electrolysed a solution using carbon electrodes. Two gases were collected as shown.

Which electrolyte was used?

A. Dilute sulfuric acid  
B. Concentrated hydrochloric acid  
C. Copper(II) sulfate  
D. Concentrated potassium iodide

30 A 60 cm³ sample of air is trapped in a gas syringe. The air is slowly passed over heated zinc in a tube until there is no further change in the volume of air.

What is the final volume of air in the gas syringe?

A. 40 cm³  
B. 60 cm³  
C. 48 cm³  
D. 72 cm³

31 Which of the following reactions does not occur in a blast furnace in the extraction of iron?

A. CaO + CO₂ → CaCO₃  
B. CaO + SiO₂ → CaSiO₃  
C. CO₂ + C → 2CO  
D. Fe₂O₃ + 3CO → 2Fe + 3CO₂
32. Which pie-chart represents the composition of a galvanised steel roof?

A. [Pie chart with iron, carbon, and zinc]
B. [Pie chart with iron, carbon, and zinc]
C. [Pie chart with carbon and zinc]
D. [Pie chart with carbon and zinc]

33. Useful fractions are obtained by the fractional distillation of petroleum. Which fraction is matched by its use?

<table>
<thead>
<tr>

<tr>
<td>D unsaturated compound</td>
<td>substitution reaction</td>
<td>nickel</td>
</tr>
</tbody>
</table>

36. A compound X has all of the following properties:
- It is a liquid at room temperature and atmospheric pressure.
- It is insoluble in water.
- It decolorises acidified potassium manganate(VII).

What could X be?

A. ethane
B. ethanoic acid
C. ethanol
D. ethene

37. Study the reaction scheme below:

\[ \text{C}_8\text{H}_{18} \xrightarrow{\text{I}} \text{C}_7\text{H}_6 \xrightarrow{\text{II}} \text{C}_6\text{H}_4\text{OH} \xrightarrow{\text{III}} \text{C}_6\text{H}_4\text{O}_2 \]

What are reactions I, II and III?

<table>

38 Which of the following statements is correct?
A Complete combustion of poly(chloroethene) produces carbon dioxide and water only
B In the polymerisation of 100 g of chloroethene, 100 g of poly(chloroethene) is formed
C In the polymerisation of chloroethene to form poly(chloroethene), there is no change in the density
D Both poly(chloroethene) and chloroethene decolourise aqueous bromine rapidly.

39 The following monomer undergoes condensation polymerisation to produce a polymer

\[ \text{H} \quad \text{O} \quad \text{C} \quad \text{H} \]

Three repeat units of this polymer are shown below:

\[ \text{O} \quad \text{O} \quad \text{O} \quad \text{O} \quad \text{O} \]

What by-product is formed each time a monomer is added to the polymer?
A Chlorine  B Water  C Hydrogen  D Hydrogen chloride

40 Kelvar is a new product which is a polyamide (naming) its structure is

Which two molecules could be condensed to form Kelvar?
A \( \text{H}_2\text{N} - \text{C} - \text{NH}_2 \) and \( \text{H}_2\text{C} - \text{C} - \text{COOH} \)
B \( \text{H}_2\text{N} - \text{C} - \text{NH}_2 \) and \( \text{H}_2\text{Cl} - \text{C} - \text{Cl} \)
C \( \text{H}_2\text{N} - \text{H} \) and \( \text{H}_2\text{C} - \text{C} - \text{COOH} \)
D \( \text{H}_2\text{COOH} - \text{CONH} \) and \( \text{H}_2\text{CO} - \text{CONH} \)

Year 4 Express
Preliminary Examination 2015

CHEMISTRY
PAPER 2 Theory
Wednesday 28 July 2015

Additional materials:
Answer paper
Calculator

TIME 1 hour 45 minutes

INSTRUCTIONS TO CANDIDATES
Write your Candidate number in the spaces at the top of this page and on any separate answer paper used.

Section A
Answer all questions.
Write your answer in the spaces provided on the question paper.

Section B
Answer all three questions from this section
The last question is in the form EITHER / OR and only one alternative should be attempted
Write your answers on the answer paper provided.
At the end of the examination, hand up the paper in one bundle

INFORMATION FOR CANDIDATES
The number of marks is given in brackets [ ] at the end of each question or part question
A copy of the Periodic Table is printed on page 20.
You may use a calculator.

FOR EXAMINER'S USE

<table>

<th>TOTAL</th>
</tr>
</thead>
</table>

This question paper consists of 20 printed pages. [Turn over
Section A
Answer all questions in the spaces provided.
The total mark for this section is 50.

A1 The graph below shows the heating curve for a pure compound at room temperature and pressure.

![Graph showing heating curve with points A and B]

a Explain why this compound is not water. [2]

b Draw the arrangement of particles in the compound at point A and B. [2]

Point A

Point B

c State the type of bonding present in this compound and explain in terms of its structure why the melting point and boiling point are below 120°C. [3]

[Total: 7]
A2 Equal masses of magnesium carbonate were added into three beakers P, Q and R as shown below

Beaker P

100 cm$^3$ of 2 mol/dm$^3$ dilute hydrochloric acid

Beaker Q

100 cm$^3$ of 2 mol/dm$^3$ dilute sulfuric acid

Beaker R

100 cm$^3$ of 2 mol/dm$^3$ ethanoic acid

After some time all the magnesium carbonate in the three beakers was reacted completely leaving behind colourless solutions.

a Write a chemical equation for the reaction between magnesium carbonate and ethanoic acid, CH$_3$COOH. [1]

b 200 cm$^3$ of gas was collected from beaker P when it is connected to a gas syringe. Would the gas collected from each of the other 2 beakers be more than, equal to, or less than 200 cm$^3$ when they are connected to gas syringes? [2]

i Volume of gas from beaker Q

ii Volume of gas from beaker R

c i Arrange the rates of reaction in ascending order for the reactions in beakers P, Q and R. [1]

ii Explain the differences in the rates of reaction in the three reactions. [3]

[Total: 7]
A3 In the combustion engine, nitrogen and oxygen reacts to form nitrogen monoxide as shown in the equation below:

\[ N_2 (g) + O_2 (g) \rightarrow 2 \text{NO} (g) \quad \Delta H = +181 \text{ kJ} \]

a) Calculate the energy change when 6 dm³ of NO is produced at room temperature and pressure. [2]

b) Complete the energy profile diagram below and label clearly the products, activation energy and the enthalpy change. [2]

```
Energy
N₂ (g) + O₂ (g)

Progress of reaction
```

c) Explain in terms of bond breaking and bond forming whether the reaction is exothermic or endothermic. [2]

d) State the source of nitrogen for the above reaction? [1]

e) Nitrogen monoxide can be removed in the catalytic converters installed in cars. Write an equation for the reaction of nitrogen monoxide and carbon monoxide in the catalytic converters [1]

f) In addition to nitrogen monoxide, nitrogen dioxide is also produced in the combustion engines. Which of these two gases is directly responsible for acid rain? Explain your reasoning. [2]

[Total : 10]
A4 In an experiment, chlorine gas was bubbled into aqueous iron(II) sulfate solution to form solution X. This is followed by adding aqueous sodium hydroxide and a reddish brown precipitate Y is produced.

The reactions are summarized in the reaction scheme below.

\[ \text{FeSO}_4 \text{ (aq)} \rightarrow \text{Cl}_2 \text{ (g)} \rightarrow \text{Solution X} \rightarrow \text{NaOH (aq)} \rightarrow \text{Reddish-brown ppt Y} \]

a i Name the precipitate Y. [1]

ii Write the ionic equation with state symbols for the precipitation of Y. [2]

b Solution X is thought to contain chloride ions. Describe the qualitative analysis test to show chloride ion is present. [2]

c The reaction between iron(II) sulfate and chlorine is a redox reaction. Explain this in terms of electron transfer. [2]

[Total : 7]
A student carried out a series of electrolysis experiments using aqueous copper(II) sulfate as shown in the diagram below.

He used the same concentration of aqueous copper(II) sulfate each time, but changed the current that passed through the solution. He consistently performed each electrolysis for 10 minutes.

The student weighed the negative electrode before and after each experiment and worked out the mass of copper deposited.

The table shows the results of his experiments.

<table>
<thead>
<tr>
<th>experiment</th>
<th>time / mins</th>
<th>current / A</th>
<th>mass of copper deposited / g</th>
</tr>
</thead>
<tbody>

</tbody>
</table>

a) Plot a graph of mass of copper deposited against current
b. Describe the relationship between the mass of the copper deposited and current as shown by your graph in (a).

[1]

c. The student carried out another experiment by passing a current of 5.0 A through the solution of copper(II) sulfate for 5 minutes. Use the graph from (a) and the information above, predict the mass of copper that would form in the experiment.

[1]

d. With reference to the above electrolysis, suggest the modifications made to the copper electrodes in the industrial purification of impure copper.

[1]

e. The student carried out another electrolysis experiment using aqueous silver nitrate and silver electrodes. His results are shown in the table below.

<table>
<thead>
<tr>
<th>electrolyte</th>
<th>time / mins</th>
<th>current / A</th>
<th>mass of silver deposited / g</th>
</tr>
</thead>
<tbody>
<tr>
<td>aqueous silver nitrate</td>
<td>10</td>
<td>4.0</td>
<td>2.7</td>
</tr>
</tbody>
</table>

i. Write a half equation with state symbols for the reaction that occurs at the negative and positive electrodes respectively.

[2]

ii. Calculate the number of moles of copper and the number of moles of silver that were formed when a current of 4.0 A was used for 10 minutes.

[2]

iii. Compare and comment on the difference between the number of moles of copper formed and the number of moles of silver formed when the same experimental conditions are used. Suggest an explanation to account for the difference.

[2]

[Total: 10]
A6 The table below shows a homologous series of organic compounds called ether.

<table>
<thead>
<tr>
<th>Name</th>
<th>Number of carbon atoms</th>
<th>Structural formula</th>
<th>Boiling point/°C</th>

</tr>
</tbody>
</table>

a. Suggest two evidences from the structural formulae to show the organic compounds belong to the same homologous series [2]

b. What is the molecular formula of the ether molecule that contains 5 carbon atoms. [1]

c. i. Define isomers [1]

ii. Draw the full structural formula of the alcohol which is an isomer of dimethyl ether. [1]

iii. Describe a suitable chemical reaction to differentiate between the alcohol and dimethyl ether. [2]

iv. The alcohol in part (ii) reacts with butanoic acid under suitable conditions to form a sweet smelling substance. Name and draw the full structural formula of this sweet smelling compound. [2]

[Total : 9]
Section B

Answer all three questions from this section.

The last question is in the form EITHER / OR and only one alternative should be attempted.

Tie any extra sheets used loosely to this booklet.

B7 Metal X is found in Group II of the Periodic Table. A student placed 0.50 g of metal X into a flask containing 80 cm³ of 1.00 mol/dm³ HCl. The volume of hydrogen gas was measured at regular intervals at 25°C. The experiment was repeated using 0.50 g of metal X and 50 cm³ of 2.00 mol/dm³ HCl.

<table>

The results obtained are shown on the following graphs:

- Graph 1: Result from Experiment 1
- Graph 2: Result from Experiment 2

a In Experiment 1, which reagent is in excess, metal X or HCl? Explain your answer. [2]

b Calculate the relative atomic mass of metal X. [3]

c Experiment 2 was repeated and an additional 0.1 g of copper was added during the reaction. The result is shown in graph 3. State and explain how copper affects the results obtained in this reaction. [2]

d Experiment 2 was carried out again but this time an additional 0.1 g of zinc was added during the reaction. The result is shown in graph 4. Explain the result. [2]

[Total: 9]
Polyacrylamide abbreviated as PAM is a polymer formed from acrylamide monomer.

It can be synthesized as a simple linear-chain structure or cross-linked. A polymer is called a linear polymer (Figure 1) because it consists of a long string of carbon-carbon bonds.

The cross-linked polymer (Figure 2) uses a cross-linking monomer to criss-cross with the long chain polymers. Each cross-linking monomer has two carbon-carbon double bonds that enable it to do so.

The polymers are used in the manufacture of soft contact lenses. More recently, it is used in aesthetic facial plastic surgery as filler placed beneath the skin.
a Is the monomer acrylamide saturated or unsaturated? Explain with reference to its structure. [2]

b Using the structural formula of the monomer given,

i) draw the structure of the linear polyacrylamide. Your answer must show at least two repeat units. [2]

ii) draw the structure of a segment of the cross-linked polymer. Your answer should include four acrylamide monomers and one cross-linking monomer. An outline of the required segment is shown below.

[Diagram of repeat unit of cross-linking monomer and repeat from acrylamide]

[c) Suggest which polymer, linear or cross-linked would more likely be

(i) a fluid and  
(ii) a solid.

Hence, suggest which is used to manufacture contact lenses and which is used as filler in aesthetic facial surgery? [2]

d] In an addition reaction, 77 g of cross-linking monomer is reacted with excess iodine molecules.

Calculate the number of moles and the mass of iodine molecules required for complete addition reaction. (relative molecular mass of the cross-linking monomer = 154) [3]

[Total: 11]

a  Name the gas that gives rise to the fastest rate of corrosion and explain why this is so.  

b  Name and explain which metal is most suitable for storing vinegar. 

c  One more set of experiments were carried out using strips of welded iron and zinc. The welded strips were then exposed to the each of the gases in moist air.

Describe and explain the appearance of iron after two weeks. 

d  Carbon monoxide and sulfur dioxide are atmospheric pollutants. Describe how they are introduced into the atmosphere. 

e  State and explain the changes observed on red litmus paper when placed in a jar containing ammonia mixed with moist air versus a jar containing dry ammonia. 

[Total : 10]
OR

B9  a  Explain the properties of the following underlined substances in terms of their bonding and structures:

i  Graphite is a good conductor of electricity and is also used as a lubricant at high temperature. [3]

ii  Particles of silicon carbide are laminated to paper to create sandpapers. (hint: Silicon is a group IV element just like carbon. Silicon carbide is a compound that has a structure similar to that of diamond.) [2]

b  Reactions of five metals P, Q, R, S and T are given below.

<table>
<thead>
<tr>
<th>Metals</th>
<th>Reactions</th>

<tr>
<td>R</td>
<td>Extracted industrially by reduction with coke. Reacts with steam.</td>
</tr>
<tr>
<td>S</td>
<td>Does not react with oxygen at room conditions</td>
</tr>
<tr>
<td>T</td>
<td>Sinks and reacts with water.</td>
</tr>
</tbody>
</table>

i  Arrange the metals in descending order of reactivity. [1]

ii  Identify which metal is calcium and write the equation for its reaction given in the table above. [2]

iii  In an experiment, a strip of metal R is placed in an aqueous nitrate of P. Explain the reaction that would occur. [2]

[Total : 10]
P1

A1

a. Melting point and boiling point of the compound are 55°C and 95°C respectively. But melting point and boiling point of water are 0°C and 100°C respectively.

b. 

Point A

Point B

C. Covalent bonding

The compound has a simple molecular structure where the discrete molecules are held together by weak intermolecular forces. These forces are easily overcome.

A2

a. \[ \text{MgCO}_3 (s) + 2 \text{CH}_3\text{COOH} (aq) \rightarrow (\text{CH}_3\text{COO})_2\text{Mg} (s) + \text{H}_2\text{O} (l) + \text{CO}_2 (g) \]

b. Volume of gas from beaker Q: Equal to 200cm³

Volume of gas from beaker R: Equal to 200cm³

c. Beaker R, beaker P, beaker Q

A3

a. No of mol of NO = 0.24 = 0.25 mol

Energy given out = 0.252X181 = 22.6 kJ

b. 

\[
\text{Energy} \quad \text{Activation energy} \quad 2\text{NO} (g) \rightarrow \text{N}_2 (g) + \text{O}_2 (g) \quad \Delta H = +194 kJ
\]

Progress of reaction

c. Endothermic

The energy taken in to break the bonds in 1 mol of nitrogen gas and 1 mol of oxygen gas is greater than the energy given out to form the bonds in 2 mol of nitrogen monoxide gas.

d. Air

e. 2 \text{NO} (g) + 2 \text{CO} (g) \rightarrow \text{N}_2 (g) + 2 \text{CO}_2 (g)

f. Nitrogen dioxide as it is an acidic oxide and could oxidize in atmosphere and reacts with rainwater to form acid rain. Nitrogen monoxide is a neutral oxide.

A4

a. i. Iron(III) hydroxide

ii. \( \text{Fe}^{3+} (aq) + 3 \text{OH}^- (aq) \rightarrow \text{Fe}(_2\text{O}_3) (s) \)

b. To a sample of solution X, add dilute nitric acid followed by aqueous silver nitrate. A white precipitate will be formed if chloride ion is present.

c. Iron(II) ion loses an electron to form iron(III) ions, this is oxidation. Chlorine gas gains electrons to form chloride ions, this is reduction.

A5

a. Mass of copper deposited = 5g

b. Mass of copper deposited is directly proportional to the current applied

e. 0.808 g

d. Anode: Impure copper, Cathode: a small piece of pure copper

A6

a. i. Negative electrode: \( \text{Ag}^+ (aq) + e^- \rightarrow \text{Ag} (s) \)

Positive electrode: \( \text{Ag} (s) \rightarrow \text{Ag}^+ (aq) + e^- \)

ii. No of mole of silver = 2.71/0.08 = 0.025 mol

No of mole of copper = 0.01/0.04 = 0.0127 mol

iii. Number of mole of silver is twice that of copper (number of mole of copper is half that of silver)

The charge of copper(II) ion is +2 and the charge of silver ion is +1.

Given the same number of electrons, the number of copper(II) ions discharged is half that of silver ions.

A8

a. They have the same general formula, \( \text{C}_2\text{H}_4\text{NO}_2 \)

The consecutive members increases by a -CH₂ group of atoms

b. \( \text{C}_2\text{H}_4\text{O} \)

c. Isomers are molecules that have the same molecular formula but different structural formulae.
**Chemistry Notes**

**Page 3**

1. In separate test tubes, add oxidized potassium permanganate (VII) to samples of ethanol and dimethyl ether and warm. Ethanol deoxygenates the purple solution, but not dimethyl ether.

2. Ethyl butyrate

3. HCl is in excess.
   Metal X is the limiting reagent and in both experiments, the same mass of metal is used up and same volume of gas produced.

   - No of mole of H₂ gas = \(\text{mass of H₂ gas} \times \text{molar mass of H₂} \) = 0.0125 mol
   - No of mole of X = 0.0125 mol
   - Relative atomic mass of X = \(\frac{\text{mass of X}}{\text{molar mass of X}}\) = 0.5 (assuming molar mass of X = 40)

4. Copper is a catalyst.
   It speeds up the reaction by providing an alternative reaction pathway, which has a lower activation energy.

5. The dilute hydrochloric acid is in excess.
   Zinc and magnesium react concurrently to produce a higher volume of gas and faster rate than experiment 2.

6. Unsaturated because of a carbon-carbon double bond.

7. **Chemical Equations**
   - **B7**
     a. \(2 \text{HCl} + \text{Zn} \rightarrow 2 \text{H}_2 + \text{ZnCl}_2\)
     b. \(\text{Cu} + 2 \text{HCl} \rightarrow \text{CuCl}_2 + 2 \text{H}_2\)
     c. \(\text{HCl} + \text{Mg} \rightarrow \text{MgCl}_2 + \text{H}_2\)

8. **B9**
   a. Sulphur dioxide is an acidic oxide and dissolves in water to form acid.
   b. Aluminium. It has a protective layer of aluminium oxide.
   c. Iron remains shiny grey. Zinc provides sacrificial protection for iron. Zinc is more reactive than iron and loses electrons more easily. It corrodes in place of iron.
   d. Carbon monoxide is produced from the incomplete combustion of carbon-containing substances due to the lack of oxygen.
   Sulphur dioxide is produced at the power station when fossil fuel is burned.
   e. Red rust turns blue in moist air and ammonia gas mixture but remains red in dry ammonia.
   Ammonia needs to dissolve in water to become an alkali and releases aqueous hydroxide ions.

9. **OR**
   a. In the structure of graphite, each carbon bond to other carbon atoms using three of the four valence electrons. The non-bonding valence electrons of the carbon atoms form the sea of delocalized electrons that make graphite a conductor of electricity.
   - The carbon atoms are covalently bonded in layers consisting of hexagonal rings. Between the layers are weak forces that can be easily overcome which make the layers slide over each other easily. Graphite can be used as a lubricant at high temperature due to the many strong covalent bonds between the carbon atoms.
   b. Silicon carbide has a rigid 3-dimensional lattice structure. A large number of carbon and silicon atoms are all joined together by strong covalent bonds in a 3 point 3-dimensional lattice structure. A lot of energy would be needed to break these bonds and the structure is hard and rigid.

**Chemical Equations**

- \(\text{Ca} + 2 \text{H}_2\text{O} (l) \rightarrow \text{Ca(OH)}_2 (aq) + \text{H}_2 (g)\)
- **Displacement Reactions**
  - R is more reactive than P. R loses electrons more easily than P and it replaces P from the aqueous nitrate solution.
1. Naturally-occurring bromine has a relative atomic mass of 80 and consists entirely of two isotopes of relative atomic masses 79 and 81.

What can be deduced about naturally-occurring bromine from this information only?
A. Bromine contains the two isotopes in equal proportions
B. Bromine has different oxidation states
C. Bromine isotopes have different numbers of protons
D. Bromine is a gaseous mixture of atoms and molecules at room temperature

2. Silicon carbide, SiC, has a structure similar to diamond. Boron nitride, BN, has a structure similar to graphite. Bronze is an alloy of copper and tin.

Which statements about SiC, BN and bronze are correct?
1. All are covalently covalent
2. All except silicon carbide conduct electricity when solid.
3. All have high melting points
A. 1 and 2 only
B. 1 and 3 only
C. 2 and 3 only
D. 1, 2 and 3

3. What correctly describes the molecules in very dilute sugar solution at room temperature?

<table>
<thead>
<tr>
<th>sugar molecules</th>

</table>

4. What can be deduced about two gases that have the same relative molecular mass?
A. They have the same boiling point
B. They have the same number of atoms in one molecule
C. They have the same rate of diffusion at room temperature and pressure
D. They have the same solubility in water at room temperature

5. One volume of a gaseous element X combines with an equal volume of gaseous hydrogen to form two volumes of a gaseous hydride. What is the formula for the hydride of X?
A. HX
B. HX X
C. HX
D. HX X

6. The mass of one mole of a chloride formed by a metal Y is 74.5 g. The formula of the chloride could be
A. YCl
C. YCl

7. The diagram shows the structure of a covalent compound containing the element hydrogen, H, and the unknown elements X, Y and Z.

To which groups of the Periodic Table do these three elements, X, Y and Z, belong?

<table>
<thead>
<tr>

8. How could a sample of potassium be obtained from potassium chloride, KCl?

method 1 adding zinc to a solution of KCl
method 2 electrolyzing an aqueous solution of KCl
method 3 electrolyzing molten KCl
A. method 1 only
B. methods 1 and 2
C. methods 2 and 3
D. method 3 only

9. Which diagram represents the structure of an alloy?

10. When a volcano erupts, which gas is produced in significant amounts?
A. carbon monoxide
B. chlorofluorocarbons
C. methane
D. sulfur dioxide
11. A concentrated aqueous solution of copper(II) chloride is electrolysed using inert electrodes. What is the product at the negative electrode?

A  chlorine  
B  copper  
C  hydrogen  
D  oxygen

12. The energy profile for the forward direction of a reversible reaction is shown.

\[ \text{activation energy} \]

\[ \Delta H^* \]

progress of reaction

Which now correctly shows both the sign of the activation energy and the type of the enthalpy change for the reverse reaction?

<table>
<thead>
<tr>

13. Which is an anion that is present in the solution formed when an excess of dilute hydrochloric acid is added to calcium carbonate?

A  Ca\(^{2+}\)  
B  Cl\(^-\)  
C  CO\(_2\)\(^{3-}\)  
D  H\(^+\)

14. Which ionic equation describes a redox reaction?

A  Ag\(^{+}\)(aq) + Cl\(^-\) (aq) → AgCl (s)  
B  2H\(^+\)(aq) + CO\(_2\)\(^{3-}\) (aq) → CO\(_2\)(g) + H\(_2\)O(l)  
C  H\(^+\)(aq) + OH\(^-\)(aq) → H\(_2\)O(l)  
D  Zn(s) + Cu\(^{2+}\)(aq) → Zn\(^{2+}\)(aq) + Cu(s)

15. Carbon and silicon are both in Group IV of the Periodic Table. Which statement is correct for both carbon dioxide and silicon dioxide?

A  They are acidic oxides  
B  They are readily soluble in water.  
C  They contain ionic bonds.  
D  They have giant molecular structures.

16. Four oxides are added separately to aqueous sodium hydroxide.

1  aluminium oxide  
2  carbon dioxide  
3  copper(II) oxide  
4  magnesium oxide

Which oxides react with aqueous sodium hydroxide?

A  1 and 2 only  
B  1, 3 and 4 only  
C  2 only  
D  3 and 4 only

17. Which is most likely use of sulfuric acid?

A  as a bleach  
B  in the manufacture of ammonia  
C  in the manufacture of fertilisers  
D  in the manufacture of battery acid

18. Which property is common to calcium, potassium and sodium?

A  Their atoms all have one electron in the outermost shell  
B  Their ions all have eight electrons in their outermost shell  
C  The ions have a lone pair at the positive electrode  
D  They are all deposited at the anode when their molten chlorides are electrolysed

19. Which two statements indicate that metal M may have a proton number between 21 and 30?

1  It conducts electricity  
2  It does not react with water  
3  It forms two basic oxides with formulas MO and MO\(_2\)  
4  It forms two coloured sulfates

A  1 and 2  
B  1 and 4  
C  2 and 3  
D  3 and 4

22. Which reaction does not involve either cation or reduction?

- A \( \text{CH}_4(g) + 2\text{O}_2(g) \rightarrow \text{CO}_2(g) + 2\text{H}_2\text{O}(g) \)
- B \( \text{CuO}(s) + \text{Zn}(s) \rightarrow \text{Cu}(s) + \text{ZnO}(s) \)
- C \( \text{CuO}(s) + \text{H}_2\text{SO}_4(\text{aq}) \rightarrow \text{CuSO}_4(\text{aq}) + \text{H}_2\text{O}(l) \)
- D \( \text{Zn}(s) + \text{H}_2\text{SO}_4(\text{aq}) \rightarrow \text{ZnSO}_4(\text{aq}) + \text{H}_2(g) \)

23. In the extraction of iron, carbon monoxide acts as

- A an oxidising agent
- B a reducing agent
- C a catalyst
- D an impurity to lower the melting point of the mixture to conserve energy

24. Magnesium can be obtained by heating magnesium oxide with which element?

- A calcium
- B hydrogen
- C carbon monoxide
- D carbon

25. The diagram shows the electrolysis of molten lead(II) bromide using inert electrodes.

What happens during this electrolysis?

- A Atoms change to ions
- B Ions change to atoms.
- C Covalent bonds are broken
- D New compounds are formed

39 Compound Q has the structure shown.

Which structure is an isomer of Q?

40 What is the partial structure of the polymer formed by the polymerisation of propene, CH₃CH=CH₂?
1. The diagram shows part of the Periodic Table. Only some of the elements are shown.

(a) Answer each of the following questions using only those elements shown in the diagram. Each element may be used once, more than once or not at all.

Give one element which:

(i) has a giant molecular structure,

(ii) combines with oxygen to form a gas which contributes to acid rain,

(iii) forms an ion of type \( X^+ \) which has only three completely filled shells of electrons,

(iv) has a chloride of type \( XCl_2 \), whose aqueous solution forms a white precipitate with aqueous sodium hydroxide but insoluble in excess of NaOH.

(b) (i) Arsenic reacts with oxygen to form arsenic(III) oxide, \( As_2O_3 \).

Construct a balanced chemical equation for this reaction.

(ii) Arsenic(III) oxide is slightly soluble in water. Arsenous acid, \( H_2AsO_3 \), a weak acid is formed.

When 100 cm\(^3\) of 0.05 mol /dm\(^3\) of both arsenous acid and hydrochloric acid is added separately to excess magnesium, will arsenous acid produce more, less or the same volume of hydrogen compared to hydrochloric acid?

Will the pH of arsenous acid solution be higher, lower or the same as hydrochloric acid?

(iii) State the chemical formula of the salt formed from the reaction between arsenous acid and magnesium.
2. Zinc carbonate thermally decomposes to form zinc oxide and carbon dioxide.

\[ \text{ZnCO}_3(s) \rightarrow \text{ZnO}(s) + \text{CO}_2(g) \]

In an experiment, a sample of a certain mass of zinc carbonate is heated in a test-tube using a bunsen burner. The total volume of carbon dioxide formed is measured every 10 seconds. The results are plotted on the graph below.

(a) Suggest why the volume of carbon dioxide does not increase very much when the zinc carbonate is first heated.

(b) Using the same flame intensity and the same particle size of lead (II) carbonate and calcium carbonate, two separate but same experiments were carried out.

Experiment (i) the same mass of lead (II) carbonate is heated.

Experiment (ii) the same number of moles of calcium carbonate is heated.

On the axes above, draw the graphs you would expect from the results of these experiments and label:

Graph (i) for experiment (i) when same mass of lead carbonate is heated, \([1]\)

Graph (ii) for experiment (ii) when same number of moles of calcium carbonate is heated. \([1]\)

3. The structures of sodium chloride and chlorine are shown below.
(a) The melting point of sodium chloride is 801 °C.
The melting point of chlorine is −101 °C.

(i) Explain, in terms of structure and bonding, the low melting point of chlorine

(ii) Explain why hydrogen chloride can conduct electricity in the aqueous state.

(b) State the two electrode half equations when concentrated aqueous sodium chloride is electrolyzed.

Anode reaction

Cathode reaction

(c) Chlorine gas reacts with ammonia gas, NH₃, to form hydrogen chloride and nitrogen gas.

Construct a balanced chemical equation with state symbols for this reaction.

4. The ester, ethyl ethanoate, reacts with hydroxide ions to form ethanoate ions and ethanol, as shown in the equation below.
\[ \text{CH}_3\text{COOC}_2\text{H}_5 + \text{OH}^- \rightarrow \text{CH}_3\text{COO}^- + \text{C}_2\text{H}_5\text{OH} \]

ethyI ethanoate ethanoate ions

(a) The graph shows how the concentration of ethanoate ions, \( \text{CH}_3\text{COO}^- \), changes as the reaction proceeds.

![Graph showing concentration of \( \text{CH}_3\text{COO}^- \) ions in mol/dm\(^3\) against time (s).]

(i) Use the information in the graph to deduce the mass of ethanoate ions in 200 cm\(^3\) of the solution when the reaction is complete.

\[ \text{mass} = \ldots \ldots \ldots g \quad [1] \]

(ii) Use the information in the graph to calculate the average rate of reaction, in mol/dm\(^3\)/s, during the first 300 seconds.
(b) Below is a molecule of fats found in our bodies and foods are in the form of 'triglyceride' molecule, which is a saturated fat.

\[
\begin{align*}
\text{Triglyceride - Saturated} \\
\end{align*}
\]

Use the example given and draw the display diagram of two products when hydroxide ion, \( \text{OH}^- \), reacts with this molecule.

5. Analysis of a yellow compound \( X \), which consists of two ions, shows it has the following composition.

<table>
<thead>
<tr>
<th>Element</th>
<th>Percentage by mass</th>
</tr>
</thead>
</table>

2015 Sec 4 Preliminary Examination Chemistry paper 2 - 59/2/2
(a) Show that X has the formula $\text{H}_2\text{NO}_2\text{V}$. 

(b) Suggest one physical property of compound X caused only by the presence of vanadium in the compound.

(c) Aqueous sodium hydroxide is added to solid X and the mixture is warmed. A colourless gas that turns moist red litmus blue is evolved. Deduce the formula of each of the two ions present in X.

(d) An acidified aqueous solution of X reacts with aqueous potassium iodide to form iodine. State what you can deduce about the chemical nature of X.

6. The flow chart shows some reactions of the compounds of a metal.
Identify, by name, each of the substances.

A ..............................................................
B ..............................................................
C ..............................................................
D ..............................................................
E ..............................................................
F ..............................................................

[6]

7. The diagram shows a simple electrochemical cell.

The voltages produced by different combinations of metal electrodes are shown in the table.

<table>
<thead>
<tr>
<th>Positive electrode</th>
<th>Negative electrode</th>
<th>Voltage / V</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
(a) Use the information in the table to deduce the order of reactivity of the metals silver, copper, R, S, T, U.

<table>
<thead>
<tr>
<th></th>
<th>R</th>
<th>+0.10</th>
</tr>

most reactive

least reactive

(b) State two metals from the table that will produce the highest voltage when used in the electrochemical cell as shown in the diagram.

Anode ........................................ and Cathode ........................................ [1]

(c) (i) Briefly state a method, to extract aluminium and zinc from its ore, such as aluminium oxide and zinc oxide respectively.

Aluminium .......................................................... [1]

Zinc .......................................................... [1]

(ii) When solid copper (II) nitrate is heated, it decomposed to copper (II) oxide, nitrogen dioxide and oxygen.

Write a chemical equation to represent the thermal decomposition of copper(II) nitrate.

.......................................................... [1]

(d) Draw the cross and dot diagram of ammonium fluoride in the space below.
8. (a) (i) Explain why attaching iron with magnesium prevents iron from rusting.

(ii) If copper is attached to iron, will iron rust slower, or faster or no difference? Explain your answer.

(b) Other than cost, state one benefit of recycling of iron.

(c) In the manufacture of iron in the blast furnace explain the presence of nitrogen in the waste gases.

9. A student titrates 20.0 cm$^3$ of a metal hydroxide, $M(OH)_2$, of concentration 0.060 mol / dm$^3$ with a strong acid of concentration 0.050 mol / dm$^3$. It requires 24.0 cm$^3$ of acid to neutralise the metal hydroxide.
(a) Calculate the number of moles of acid in 24.0 cm$^3$ of the acid.

\[ \text{\ldots moles} \quad [1] \]

(b) Calculate the number of moles of OH$^-$ ions in 20.0 cm$^3$ of the metal hydroxide.

\[ \text{\ldots moles} \quad [1] \]

(c) Deduce whether the acid used is more likely to be hydrochloric acid or sulfuric acid.

\[ \text{\ldots} \quad [1] \]

(d) Explain why barium sulfate should not be prepared by adding sulfuric acid to barium oxide?

\[ \text{\ldots} \quad [1] \]

10. Silicone fluids are polymers. Part of the structure of a silicone fluid is shown below.
The monomer used in making this silicone fluid is a saturated compound. Deduce the structure of this monomer.

(a) Draw the structure of the repeating unit of this polymer

(b) If this is a condensation polymer, draw the monomer of this polymer.

SECTION.B (30 marks)
Answer all three questions in this section. The last question is in the form of an either/or and only one of the alternatives should be attempted.

11. The table below shows some properties of the Group 0 elements (noble gases).

<table>
<thead>
<tr>
<th>élément</th>
<th>density of liquid element in g/cm³</th>
<th>boiling point /°C</th>
</tr>
</thead>
<tbody>
<tr>
<td>helium</td>
<td>0.15</td>
<td>-269</td>
</tr>
<tr>
<td>neon</td>
<td>1.20</td>
<td>-246</td>
</tr>
<tr>
<td>argon</td>
<td>1.40</td>
<td>-186</td>
</tr>
<tr>
<td>krypton</td>
<td>3.52</td>
<td>-152</td>
</tr>
<tr>
<td>xenon</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(a) Describe the changes in density and boiling point of the elements in group 0 from helium to xenon.

(b) Explain why noble gases are inert and not reactive.

(c) Several compounds of the noble gases have been produced in recent years, e.g. fluorides of xenon.

(i) Complete the equation for the reaction of xenon(IV) fluoride with water.

\[ \text{XeF}_4 + \text{H}_2\text{O} \rightarrow \text{Xe} + \text{XeO}_3 + \text{O}_2 + \text{HF} \]

(ii) Predict the pH of the solution after this reaction.

(d) Xenon (VI) fluoride, \( \text{XeF}_6 \), with a m.p. of 49°C and b.p. of 76°C reacts with water to form a mixture which contains xenon, xenon(VI) oxide, \( \text{XeO}_3 \), and hydrogen fluoride, HF and oxygen gas in step 3.

Xenon hexafluoride, \( \text{XeF}_6 \), hydrolyses to \( \text{XeO}_3 \), stepwise in 3 steps, of which only two steps is shown below.

\[
\begin{align*}
\text{Step 1} & \quad \text{XeF}_6 + \text{H}_2\text{O} \rightarrow \text{XeOF}_4 + 2 \text{HF} \\
\text{Step 2} & \quad \text{XeOF}_4 + \text{H}_2\text{O} \rightarrow \text{XeO}_2\text{F}_2 + 2 \text{HF}
\end{align*}
\]

(i) Determine the oxidation number of the xenon in compound, \( \text{XeO}_2\text{F}_2 \), formed in step 2.
Using the information from reactions in step 1 and step 2, predict the balanced chemical equation for the reaction in step 3 when $\text{XeO}_2\text{F}_2$ hydrolys further with water.

Neon is also a noble gas, state one commercial use of neon.

- Is xenon (VI) fluoride a covalent or ionic compound? Give a reason for your answer from the information given above.

12. Ammonia is manufactured by the Haber process

$$\text{N}_2 + 3\text{H}_2 \rightleftharpoons 2\text{NH}_3$$

(a) State what does the symbol \(\rightleftharpoons\) means.

The table below shows how the percentage yield of ammonia varies with both temperature and pressure.

<table>
<thead>
<tr>
<th>pressure /atmospheres</th>
<th>% yield at 200°C</th>
<th>% yield at 300°C</th>
<th>% yield at 400°C</th>
<th>% yield at 500°C</th>
</tr>
</thead>
<tbody>
<tr>
<td>30</td>
<td>68</td>
<td>32</td>
<td>11</td>
<td>4</td>
</tr>
<tr>
<td>100</td>
<td>81</td>
<td>51</td>
<td>25</td>
<td>10</td>
</tr>
<tr>
<td>200</td>
<td>86</td>
<td>63</td>
<td>36</td>
<td>18</td>
</tr>
<tr>
<td>300</td>
<td>88</td>
<td>69</td>
<td>40</td>
<td>24</td>
</tr>
</tbody>
</table>

(b) (i) Using the information above, describe how the percentage yield of ammonia changes with temperature and pressure.

(ii) Explain how using a catalyst in the Haber process has an economic advantage.
Farmers use chemicals to improve crop yield. Ammonium phosphate, \((\text{NH}_4\text{)}_3\text{PO}_4\), is used as a fertiliser and calcium hydroxide, \(\text{Ca(OH)}_2\), is used to reduce the acidity of soils.

The relative formula mass of ammonium phosphate is 149.

(c) Calculate the percentage by mass of nitrogen in ammonium phosphate.

\[
\text{percentage} = \frac{\text{mass of nitrogen}}{\text{mass of ammonium phosphate}} \times 100 \%
\]

(d) A farmer adds ammonium phosphate to a field. He then adds calcium hydroxide to the field because the soil is very acidic.

(i) Calcium hydroxide neutralises acid in soil. Give an ionic equation for this reaction.

\[
\text{Ca(OH)}_2 + 2\text{H}^+ \rightarrow \text{Ca}^{2+} + 2\text{H}_2\text{O}
\]

(ii) Adding calcium hydroxide together with ammonium phosphate reduces the effectiveness of ammonium phosphate as a fertiliser. Explain.

(e) (i) State one man made source of oxides of nitrogen.

(ii) Use chemical equation(s), to show how the production of oxides of nitrogen can be reduced in cars.

(f) State one natural source of methane.
13. The alkanes are a homologous series of hydrocarbons.

(a) Jezicar and Authoree had a discourse on the molecules below.

Molecule A

\[
\begin{array}{c}
\text{H} \\
\text{H} \\
\text{H} \\
\text{H} \\
\text{C} \\ \\
\text{C} \\
\text{C} \\
\text{H} \\
\end{array}
\]

Molecule B

\[
\begin{array}{c}
\text{H} \\
\text{H} \\
\text{H} \\
\text{H} \\
\text{H} \\
\text{C} \\
\text{C} \\
\text{C} \\
\text{H} \\
\end{array}
\]

Molecule C

\[
\begin{array}{c}
\text{H} \\
\text{H} \\
\text{H} \\
\text{H} \\
\text{C} \\ \\
\text{C} \\
\text{C} \\
\text{C} \\
\text{H} \\
\end{array}
\]

Jezicar says that both molecule A and B are in the alkane homologous series, but Authoree believes that molecule A and B are in a different homologous series because they both do not share the same general formula.

From the information above,

(i) suggest a reason, why Jezicar may be right.

........................................................................................................................................................................
........................................................................................................................................................................
........................................................................................................................................................................[1]

(ii) State the condition/s for the chemical reaction between an alkane and chlorine

condition/s .................................................................[1]

(iii) In terms of bond making and bond breaking state whether the chemical reaction between an alkane and chlorine is an exothermic or endothermic reaction?

........................................................................................................................................................................
........................................................................................................................................................................
........................................................................................................................................................................[1]
(iv) Molecule C behaves just like an unsaturated hydrocarbon. Draw the display diagram of the product formed when excess bromine is completely reacted with molecule C.

(v) Draw a energy profile diagram for the reaction between molecule A and chlorine. Label the activation energy, enthalpy change and also label the axes.

(b) One mole of undecane, C_{11}H_{24}, is cracked to form a mixture containing one mole of ethene, one mole of propene and one mole of another substance.

State the formula of the other substance.

........................................................................................................................................ [1]

(c) Butanoic acid, C_4H_7COOH, reacts with sodium to form a salt and a gas. State the name and formula of the salt.

Name ........................................................................................................................................

formula ................................................................................................................................... [2]
(d) If butan 1,4 diol, \( \text{HOCC}_2\text{H}_4\text{COH} \), display diagram shown below

\[
\begin{array}{cccc}
\text{H} & \text{H} & \text{H} & \text{H} \\
\text{I} & \text{I} & \text{I} & \text{I} \\
\text{H} & \text{O} & \text{C} & \text{C} & \text{C} & \text{C} & \text{O} & \text{H} \\
\text{I} & \text{I} & \text{I} & \text{I} \\
\text{H} & \text{H} & \text{H} & \text{H}
\end{array}
\]

is reacted completely with excess acidified potassium manganate \((\text{VII})\), state the display diagram of the product form in the box below.

[1]
14. A series of reactions based on propanoic acid is shown.

\[
\begin{array}{c}
\text{CH}_3\text{CH}_2\text{CO}_2\text{H} \quad \text{CaCO}_3 \quad \text{three products} \\
\text{CH}_3\text{CH}_2\text{CH}_2\text{OH} \quad \text{reaction 2} \quad \text{reaction 3} \quad \text{CH}_3\text{CO}_2\text{CH}_2\text{CH}_2\text{CH}_3
\end{array}
\]

(a) (i) When propanoic acid reacts with calcium carbonate, there is effervescence and the solution feels warm. Write a balanced chemical equation for the reaction between propanoic acid and calcium carbonate.

........................................................................................................................................................................... [1]

(ii) State the name of the salt formed in reaction between CH₃CH₂COOH and calcium carbonate.

........................................................................................................................................................................... [1]

(iii) Draw a labelled energy profile diagram for the reaction between CH₃CH₂COOH and calcium carbonate.

........................................................................................................................................................................... [2]

(b) (i) Name the type of reaction for the conversion of CH₃CH₂CH₂OH to CH₃CH₂COOH in reaction 2?

........................................................................................................................................................................... [1]

(ii) Suggest the name of type of reaction for the conversion of CH₃CH₂COOH to CH₃CH₂CH₂OH in reaction 1.

........................................................................................................................................................................... [1]

(c) Suggest a suitable reagent and experimental conditions for reaction 3.

........................................................................................................................................................................... [2]
(d) State the name of an alkene and the experimental conditions to convert this alkene to CH₃CH₂CH₂OH.

Name of alkene

Conditions

[2]

partnerinlearning@hotmail.com
4 (a) When the reaction is complete, concentration of \( CH_3COO^- \) is 0.45 mol/dm\(^3\).

\[ \text{No. of mol of ethanoate ions} = 0.45 \times \frac{2 \text{ mol}}{1000 \text{ dm}^3} = 0.0009 \text{ mol} \]

Mass of ethanoate ions = 0.09 \times 58 = 5.21 \text{ g (3 s.f.)} \]

(b) Rate of reaction = \( \frac{0.0009 \text{ mol/dm}^3}{3 \text{ s.f.}} \)

5 (a) (i) Chlorine has a molecular structure made up of discrete molecules. Liquid nitrogen is required to overcome the weak intermolecular forces of attraction between these molecules. Hence, it has low boiling point.

(ii) Hydrogen chloride is soluble in water and dissociates into \( H^+ \) and \( Cl^- \) ions which can conduct electricity.

(iii) Anode: \( 2 \text{Cl}^- \rightarrow \text{Cl}_2 (g) + 2e^- \)

Cathode: \( 2 \text{H}^+ (aq) + 2e^- \rightarrow \text{H}_2 (g) \)

(c) \( 2 \text{NH}_3 (g) + 3 \text{Cl}_2 (g) \rightarrow 6 \text{HCl (g)} + \text{N}_2 (g) \)

5 (a) (i) Water and \( NH_3 \) are shown.

(b) It is a colourless compound (yellow).

(c) Positive ion \( NH_4^+ \)

(d) It is an oxidising agent.

6

A. Copper (II) carbonate
B. Carbon dioxide
C. Copper (II) sulphate
D. Copper (II) hydroxide
E. Magnesium sulphate
Copper

7 a) (Most reactive) T > U > S > Copper > H > Silver (Least reactive)
   b) Anode: T, Cathode: Silver
   c) (i) Aluminium: Electrolysis of molten Al₂O₃, Zinc: Reduction of zinc oxide by carbon
   d) (ii) 2Cu(NO₃)₂ → 2 CuO + O₂ + 4 NO₂

8 a) (i) Magnesium is more reactive than iron, hence it loses electrons more readily and will corrode in place of iron
   b) Faster iron is more reactive than copper, hence it will lose electrons more readily to Cu and will rust faster
   c) Iron is a finite resource and recycling iron will ensure the slower depleation of the non-renewable resource
   d) Air is pumped into the blast furnace, which contains 78% of nitrogen which is not used in the reaction

9 a) No. of moles of acid = 0.050 × \frac{23}{180} = 0.0012 mol
   b) No. of moles of M(OH)₂ = 0.050 × \frac{20}{250} = 0.0020 mol
   M(OH)₂ → M⁺ + 2OH⁻
   No. of moles of OH⁻ ions = 0.0012 × 2 = 0.0024 mol
   c) Sulfuric acid
   d) H₂SO₄ (aq) + BaO (s) → BaSO₄ (s) + H₂O (l)

The reaction produces insoluble BaSO₄ which will form a layer of coating around BaO, preventing further reacting with H₂SO₄, Reaction will not go to completion

10 a) \[ \begin{align*}
C₃H₄ & \rightarrow \underbrace{C₃H₅}_n \\
H-O-Si-OH & \rightarrow \underbrace{Si—O}_n
\end{align*} \]

11 a) Bohr density and boiling point increase from He to Ar
   b) Noble gases have a fully filled outermost shell, hence they have no tendency to lose or gain electrons
   c) (i) 4 XeF₆ + 8 H₂O → 2Xe + 2XeO₃ + O₂ + 16 HF
   d) (i) pH 4.2 → 23.4
   (ii) XeO₃ + H₂O → XeO₄ + 2HF
   (iii) Fill the bulbs of neon lamps
   (iv) Simple covalent compound. It has a low melting (40°C) and boiling point (76°C)

12 a) Reversible reaction
   b) (i) As pressure increases from 70 to 300 atm, percentage yield of ammonia increases. As temperature increases from 300°C to 500°C, the percentage yield of ammonia decreases
   c) Catalyst provides an alternative pathway with lower activation energy which results in more particles having energy greater than activation energy, thus increasing the frequency of effective collisions and the rate of reaction. Thus, lower energy will be required and thus less cost spent on electricity
   d) % by mass = \( \frac{X(100)}{100} \times 100% = 28.2% \) (3 sig f)
(a) H⁺ (aq) + OH⁻ (aq) → H₂O (l)

(b) Adding sodium hydroxide to ammonium phosphate will result in a reaction where ammonia gas will be liberated. Nitrogen essential for healthy plant growth will be lost in the form of ammonia gas.

(c)(i) Exhaust of car engines / Burning of fossil fuels in car engines

(c)(ii) 2 NO₂ + 2 CO → N₂ + 2CO₂

(d) Decay of plants/dead matter

13 Either

(a) (i) Molecule A and B are saturated hydrocarbons

(a) (ii) UV light

(a) (iii) Energy absorbed for the bond breaking of bonds in chlorine and chlorine is more than the energy released for the bond forming of bonds in chlorine-substituted alkane, hence it is an endothermic reaction

(a) (iv) Energy / L J

14 Either

(a) (i) CaC₂H₄

(a) (ii) Sodium butanoate

(a) (iii) Sunlight

(a) (iv) 2C₂H₄COOH + CaCO₃ → (C₂H₄COO)₂Ca + CO₂ + H₂O

(b) Calcium propanoate

(b) (i) Oxidation

(b) (ii) Reduction

(c) Reactant CH₃COOH, concentrated sulfuric acid

Conditions: Heat under reflux

(c) (i) Propene

(c) (ii) H₂O (l), 360°C, 50 atm, H₃PO₄ (aq)
Paper 1: Multiple Choice Questions [40 marks]

1. A sample of nitrogen dioxide gas is cooled and the temperature is measured every minute. The following graph is obtained.

```
Temperature/°C
A
B
C
D
```

Which describes the arrangement and movement of the particles in the region C – D?

<table>
<thead>
<tr>
<th>Arrangement of particles</th>
<th>Movement of particles</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Closely packed in orderly arrangement</td>
</tr>
<tr>
<td>B</td>
<td>Closely packed in disorderly arrangement</td>
</tr>
<tr>
<td>C</td>
<td>Closely packed in disorderly arrangement</td>
</tr>
<tr>
<td>D</td>
<td>Mixture of particles closely packed in orderly and disorderly arrangement</td>
</tr>
</tbody>
</table>

2. At -200°C, a mixture of liquid oxygen, nitrogen and xenon is heated up by 15°C. The boiling points of some gases are given in the table below.

```
<table>
<thead>
<tr>
<th>Gases</th>
<th>Boiling point/°C</th>
</tr>
</thead>
<tbody>
<tr>
<td>Nitrogen</td>
<td>-196</td>
</tr>
<tr>
<td>Xenon</td>
<td>-108</td>
</tr>
<tr>
<td>Oxygen</td>
<td>-183</td>
</tr>
</tbody>
</table>
```

Which of the substances will be in the liquid state at this higher temperature?

A. nitrogen only  
B. xenon only  
C. a mixture of nitrogen and oxygen  
D. a mixture of xenon and oxygen
3 A gaseous mixture of ammonia, oxygen, carbon dioxide and chlorine was passed through the set-up shown in the diagram below. Only one gas was collected in the gas jar.

Which statement describes a property of the gas collected in the gas jar?

A It bleaches moist blue litmus paper
B It forms a white precipitate when bubbled into limewater
C It relights a glowing splint
D It turns moist red litmus paper blue

4 The apparatus can be used to show the diffusion of gases. Two beakers containing gas P were placed over two porous pots containing gases Q and R respectively. The results are shown below.

What is the correct order of the relative molecular mass of gases P, Q and R?

Lowest \( M_r \) \( \rightarrow \) Highest \( M_r \)
A \( P \) \( \rightarrow \) \( Q \)
B \( Q \) \( \rightarrow \) \( P \)
C \( Q \) \( \rightarrow \) \( R \)
D \( P \) \( \rightarrow \) \( R \)

5 Solid samples of ammonium chloride, lead(II) chloride and sodium chloride were accidentally mixed together. Which of the following sequences outlines the best method to obtain the pure dry sample for each substance?

A Dissolving, filtration, sublimation, crystallisation
B Dissolving, fractional distillation, filtration, evaporation
C Sublimation, dissolving, filtration, evaporation
D Sublimation, filtration, evaporation, crystallisation

6 The diagram shows the chromatogram obtained by analysis of a single dye. Three measurements are shown.

Which expression shows the \( R_i \) value of the dye?

A \( \frac{x}{y} \)
B \( \frac{y}{x} \)
C \( \frac{x}{y+z} \)
D \( \frac{y}{x+y+z} \)
7 When a saturated solution of copper(II) sulfate is allowed to cool from 80°C to room temperature, crystals separate out from the solution.

The following statements were made about crystallisation:

1. The concentration of the solution remains the same.
2. The mass of the dissolved copper(II) sulfate in the solution changes.
3. The mass of the solvent in the solution remains the same.
4. The solubility of copper(II) sulfate decreases as the temperature falls.

Which statement(s) is/are correct?

A. 1 and 2 only
B. 1 and 3 only
C. 2, 3 and 4
D. 4 only

8 Which of the following substances contain delocalised mobile electrons?

I. Copper
II. Graphite
III. Molten copper(II) chloride
IV. Solid copper(II) chloride

A. I and II
B. I and III
C. II only
D. II, III and IV

9 Which graph shows the solution formed when one mole of a weak acid, HX, is dissolved in 1 dm³ of water?

A. Concentration (mol/L)

B. Concentration (mol/L)

C. Concentration (mol/L)

D. Concentration (mol/L)
10 Phosphine has the formula PH₃. It has similar properties to ammonia. What are the ions produced when phosphine dissolves in water?

A  PH₃⁺, H⁺
B  PH₄⁺, H⁺
C  PH₃⁺, OH⁻
D  PH₄⁺, OH⁻

11 A new indicator has just been produced in the laboratory. It changes colour according to the table below:

<table>
<thead>
<tr>
<th>pH</th>
<th>Colour</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 - 3</td>
<td>Red</td>
</tr>
<tr>
<td>4 - 7</td>
<td>Green</td>
</tr>
<tr>
<td>8 - 14</td>
<td>Dark blue</td>
</tr>
</tbody>
</table>

This indicator would be suitable to distinguish between:

A  aqueous ammonia and sodium hydroxide
B  aqueous sodium chloride and water
C  aqueous sodium nitrate and sodium hydroxide
D  dilute hydrochloric acid and dilute sulfuric acid

12 When excess calcium carbonate pieces are added to dilute hydrochloric acid, the reaction gradually becomes slower and finally stops.

Which statement best explains why the rate of reaction becomes slower?

A  An insoluble layer of calcium chloride is formed on calcium carbonate
B  The concentration of hydrochloric acid gradually reduces to zero
C  The mass of calcium carbonate decreases throughout the reaction
D  The pieces of calcium carbonate gradually become smaller

13 Three substances were added separately to aqueous potassium sulfate and aqueous potassium carbonate. The three substances were:

I  aqueous ammonia
II  barium nitrate solution
III  dilute hydrochloric acid

Which substance(s) would give different observations when added separately to aqueous potassium sulfate and aqueous potassium carbonate?

A  I only
B  I and II
C  II and III
D  III only

14 The scheme below shows some reactions of salt Y

\[ \text{Salt Y} \xrightarrow{+ \text{dilute HNO}_3} \text{Colourless solution} \xrightarrow{+ \text{Ba(NO}_3)_2} \text{White precipitate} \]

\[ \text{White precipitate} \xrightarrow{+ \text{excess aqueous NH}_3} \text{White precipitate} \]

What is salt Y?

A  aluminum sulfate
B  calcium chloride
C  lead(II) chloride
D  zinc sulfate
15 When a mixture of iron(II) sulfate, potassium hydroxide and barium chloride is stirred with some water, a mixture of green and white solids is formed. What are the identities of the solids?

- A  iron(II) chloride
- B  iron(II)-hydroxide
- C  barium sulfate
- D  potassium chloride

16 A textbook writes 'Nitric acid, HNO₃, is a strong oxidising agent.' Which of the following cannot be a product of nitric acid in its reaction with a reducing agent?

- A  N₂
- B  N₂O₅
- C  NO
- D  NO₂

17 Zinc oxide is produced by heating zinc carbonate

\[ \text{ZnCO}_3 \rightarrow \text{ZnO} + \text{CO}_2 \]

What is the percentage yield of zinc oxide if 125 g zinc carbonate produces 75 g of zinc oxide when heated?

- A  \( \frac{75}{81} \times 100 \%
- B  \( \frac{81}{75} \times 100 \%
- C  \( 125 \times \frac{81}{75} \times 100 \%
- D  \( 125 \times \frac{75}{81} \times 100 \%

18 A pure compound contains 24 g of carbon, 4 g of hydrogen and 32 g of oxygen. What is the empirical formula of the compound?

- A  CHO
- B  CH₂O
- C  CH₄O
- D  C₂H₂O

19 5.0 dm³ of sulfur dioxide is reacted with 3.0 dm³ of oxygen at room temperature and pressure. The equation for the reaction is given below.

\[ 2\text{SO}_2 (g) + \text{O}_2 (g) \rightarrow 2\text{SO}_3 (g) \]

What is the total volume of gas(es) at the end of the reaction? (Assume that the reaction goes to completion)

- A  4.0 dm³
- B  5.0 dm³
- C  5.5 dm³
- D  6.0 dm³
20 Two identical flasks, A and B, have been filled up with gases X and Y and they are placed on a balance at room temperature and pressure. The results are shown below.

Which of the following statements can be deduced from the results?

A. The molar mass of gas particles in flask A is greater than the molar mass of gas particles in flask B.
B. The molar volume of gas particles in flask A is greater than the molar volume of gas particles in flask B.
C. The number of gas particles in flask A is greater than the number of gas particles in flask B.
D. The number of moles of gas particles in flask A is greater than the number of moles of gas particles in flask B.

21 The scheme shows four stages I to IV in the conversion of solid candle wax C_{36}H_{72} into carbon dioxide and water.

Which of the following stages are exothermic?

A. I and II
B. I, II and III
C. I and IV
D. III and IV

22 The decomposition of hydrogen peroxide is carried out under different conditions in three experiments at room temperature and pressure. A common catalyst used for decomposition reaction is manganese(IV) oxide (MnO_2). An equation for the reaction is given below.

\[ 2 \text{H}_2\text{O}_2(\text{aq}) \xrightarrow{\text{MnO}_2} 2 \text{H}_2\text{O}(l) + \text{O}_2(g) \]

<table>
<thead>
<tr>
<th>Experiment</th>
<th>Conditions</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Absence of catalyst</td>
</tr>
<tr>
<td>2</td>
<td>Presence of MnO_2 powder</td>
</tr>
<tr>
<td>3</td>
<td>Presence of MnO_2 lumps</td>
</tr>
</tbody>
</table>

Which graph shows how the volume of oxygen gas produced varies with time in each experiment?
23 The graph shows the consumption of different metals in the United States in 2007. It also shows the percentage of metals recycled and mined in order to meet the consumption levels.

**US Metal Consumption (2007)**

<table>
<thead>
<tr>
<th>Metal</th>
<th>Consumption</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lead</td>
<td>1.48%</td>
</tr>
<tr>
<td>Iron/Steel</td>
<td>12.3%</td>

<td>0.04%</td>
</tr>
<tr>
<td>Zinc</td>
<td>1.17%</td>
</tr>
</tbody>
</table>

Which of the following statements may be true?

A. Demand for nickel is higher than for copper.
B. Less pollution is generated when lead is recycled compared to when it is mined.
C. Recycling zinc is cheaper than extracting zinc from its ore.
D. The mass of magnesium mined is approximately equal to the mass of iron mined.

24 Equal masses of iron(II) oxide were heated separately in oxygen and hydrogen. What changes (if any) would you expect in the masses of the iron(II) oxide after heating?

<table>
<thead>
<tr>
<th>Reaction</th>

26 Rubidium is an element in Group 1 of the Periodic Table. The following statements were made about rubidium:

1. Rubidium conducts electricity only when it is in solid state.
2. Rubidium is soft and can be cut easily with a knife.
3. Rubidium reacts with chlorine to form a white compound rubidium chloride.
4. Rubidium reacts explosively with water to form an acidic solution.

Which statements about rubidium are true?

A. 1 and 2 only
B. 1, 2 and 3 only
C. 2 and 3 only
D. 2, 3 and 4 only
27 Which statement about groups in the Periodic Table is correct?

A All groups contain both metals and non-metals
B Atoms of elements in the same group have the same number of electron shells
C In Group I, reactivity decreases with increasing proton (atomic) number.
D In Group VII, the melting point of the elements increases with increasing proton (atomic) number.

28 Which one of the following properties is true for all metals?

A All metals are good electrical conductors.
B All metals form coloured compounds
C All metals react with dilute acids to produce hydrogen
D All metals show variable oxidation states

29 The table below shows some properties of four metals and their compounds

<table>
<thead>
<tr>

</table>
32 The diagram shown is not complete.

What would be shown at X after the solution has been electrolysed for some time?

A. O₂, H₂
B. Cl₂, H₂
C. O₂, H₂
D. H₂, Cl₂

33 Consider the following chemical cell.

Which of the following changes would lead to an increase in the voltage of the cell?

I. The copper electrode is replaced with an iron electrode
II. The sodium chloride solution is replaced with a sugar solution
III. The zinc electrode is replaced with a magnesium electrode

A. I only
B. I, II and III
C. I and III
D. III only

34 In an electrolysis experiment, the same amount of charge deposited 54.0 g of silver and 14.9 g of tin.

What was the charge on the tin ion?

A. 1+
B. 2+
C. 3+
D. 4+

35 Which row correctly describes the electrodes and electrolyte used during the electroplating of a chromium bracelet with silver?

<table>
<thead>
<tr>

</tbody>
</table>

Which of the compounds below are isomers of structure 1?

37 The structure of an organic compound is shown below

Which one of the following statements is not correct?

A Its aqueous solution reacts with sodium carbonate
B It decolourises an aqueous solution of bromine.
C It turns acidified potassium dichromate(VI) from orange to green
D It is an unsaturated compound

A 2 and 3  B 2 and 5  C 3 and 4  D 4 and 5
39 When an alke reacts with two moles of bromine, the product formed is

\[ \text{Br} - C - C - C - C - C - C - C - C - \text{Br} \]

This implies that the original structure of the alke is

A

\[ \text{C} = \text{C} = \text{C} = \text{C} \]

B

\[ \text{C} = \text{C} = \text{C} = \text{C} \]

C

\[ \text{H} - \text{C} = \text{C} = \text{C} = \text{C} - \text{H} \]

D

\[ \text{Br} - \text{C} = \text{C} = \text{C} = \text{C} - \text{Br} \]

40 A condensation polymer is made from the two monomers below

\[ \text{H} - \text{O} - \text{C} = \text{C} - \text{O} - \text{H} \quad \text{and} \quad \text{H} - \text{N} - \text{CH}_2 - \text{C} = \text{C} - \text{CH}_2 - \text{N} - \text{H} \]

Which diagram shows part of the structure of the polymer formed?

A

\[ \text{O} - \text{C} = \text{C} - \text{N} - \text{CH}_2 - \text{C} = \text{C} - \text{N} - \text{H} \]

B

\[ \text{O} - \text{O} - \text{N} - \text{C} = \text{C} - \text{N} - \text{O} - \text{O} \]

C

\[ \text{O} - \text{C} = \text{N} - \text{CH}_2 - \text{C} = \text{C} - \text{N} - \text{O} - \text{O} \]

D

\[ \text{O} - \text{O} - \text{H} - \text{O} - \text{H} - \text{O} - \text{O} \quad \text{NH}_2 \quad \text{NH}_2 \]
READ THESE INSTRUCTIONS FIRST

Write your name, index number and class on all the work you hand in.
Write in dark blue or black pen.
You may use a soft pencil for any rough working. You may use a calculator.
Do not use staples, paper clips, highlighters, glue or correction fluid.
DO NOT WRITE ON THE MARGINS.
A copy of the Periodic Table is printed on page 11.

Section A
Answer all questions in the spaces provided.

For examiner’s use only: Section A / 50

At the end of the examination, fasten all your work for each section securely together.
Hand in each section separately.
The number of marks is given in brackets [ ] at the end of each question or part question.

This document consists of 11 printed pages, including this cover page.
Page 12 has been intentionally left blank.

[Turn over]
Section A (50 marks)

Answer all questions in the spaces provided.

A1 The data in the table below describe two properties of some substances. The letters are not the actual symbols of the elements in the Periodic Table.

<table>
<thead>
<tr>
<th>Element / Compound</th>
<th>Appearance at room temperature and pressure</th>
<th>Products of burning in oxygen</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Black solid</td>
<td>Carbon dioxide</td>
</tr>
<tr>
<td>B</td>
<td>Colourless gas</td>
<td>Water</td>
</tr>
<tr>
<td>C</td>
<td>Colourless gas</td>
<td>(Does not burn in oxygen)</td>
</tr>
<tr>
<td>D</td>
<td>Yellow solid</td>
<td>Sulfur Dioxide</td>
</tr>
<tr>
<td>E</td>
<td>Colourless liquid</td>
<td>Carbon Dioxide and water</td>
</tr>
</tbody>
</table>

You may use the letter once, more than once or none at all to answer the questions below.

(a) (i) Which substance is mostly likely to be hydrogen? ...

(ii) Which substance is most likely to be a compound? ...

(b) Carbon monoxide is an atmospheric pollutant that may be produced when substance A burn in oxygen. What harmful effect does carbon monoxide have on human health? ...

Page 2 of 12
(c) (i) Gas C is an element that does not burn in oxygen. Suggest the name of this substance C. [1]

(ii) Explain your answer in (c)(i). [1]

[Total marks: 6]

A2 The diagram shows the electrolysis of three different solutions using inert electrodes.

(a) (i) Write equations for the reactions that happen at each electrode in Cell B during electrolysis. Include state symbols.
(ii) Describe two observations that take place in Cell B. Explain your observations.

(b) If 6.0 dm$^3$ of oxygen is liberated from Cell A at room temperature pressure,

(i) Calculate the increase in mass of the cathodes in Cell A and Cell C

(ii) What is another observation in Cell A? Explain your observation.

(c) The experiment is repeated and the electrodes in Cell C have been changed to silver electrodes. How would you expect the results for this experiment to differ from the first experiment? Explain your answer.

[Total marks: 13]
A3 A student carried out a series of experiments to determine the rate of reaction between zinc and dilute hydrochloric acid (HCl) by measuring the volume of gas produced per unit time. In Experiment 1 (conducted at 25 °C), he used 5 g of zinc granules and 30 cm³ of 0.5 mol/dm³ dilute hydrochloric acid. The experiments were repeated two more times, with different variables.

Experiment 2: 5 g of zinc powder and 30 cm³ of 0.5 mol/dm³ of HCl, 25 °C
Experiment 3: 5 g of zinc granules and y cm³ of z mol/dm³ of HCl, 25 °C

The graph below shows the volume of gas produced over time.

![Graph showing volume of gas produced over time]

(a) Complete the diagram below with the appropriate apparatus used in the experiment. [1]
(b) Write a balance equation for the reaction between zinc and dilute hydrochloric acid.

(c) On the graph above, sketch and label the graph for Experiment 2.

(d) Taking reference from the graph above, suggest appropriate values for y and z.

\[ y = \ldots \ldots \ldots \ldots \ldots \ldots \text{cm}^3 \]
\[ z = \ldots \ldots \ldots \ldots \ldots \ldots \text{mol/dm}^3 \]

(e) The student repeated the experiment at 50 °C. Explain in terms of energy and particle collisions how an increase in temperature increases the rate of a reaction.

[Total marks: 8]
A4 The table below shows the results of some of the chemical reactions of four unknown metals.

<table>
<thead>
<tr>
<th>Metals</th>
<th>Thermal decomposition of metal carbonates</th>
<th>Reaction of metal with cold water</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Greenish-blue solid turns black. White precipitate formed when gas produced is being passed through limewater</td>
<td>No reaction</td>
</tr>
<tr>
<td>B</td>
<td>White solid remains. No gas was produced.</td>
<td>Very vigorous reaction</td>
</tr>
<tr>
<td>C</td>
<td>White solid turns yellow, turns back to white after when cooled. White precipitate formed when gas produced is being passed through limewater</td>
<td>No reaction</td>
</tr>
<tr>
<td>D</td>
<td>White solid remains white. White precipitate formed when gas produced is being passed through limewater</td>
<td>Little bubbles formed on the surface of the metal</td>
</tr>
</tbody>
</table>

(a) Arrange the metals in ascending order of their chemical reactivity.

[1]

(b) Metal A and D are placed into two separate beakers of iron(III) sulfate solution. Describe the observations you will see in each beaker.

[3]
(c) Pure iron can be extracted using the Blast furnace in the presence of carbon monoxide.

(i) State the three raw materials needed for the extraction of pure iron using the Blast furnace. [2]

(ii) Write a balanced equation, with state symbols, for the reaction mentioned in (c). [2]

(d) Iron oxidises to form iron(III) oxide, which is also known as rust.

(i) State the conditions needed for rusting to take place. [1]

(ii) Using your knowledge of the reactivity series of metals, describe and explain how rusting can be prevented. [2]

[Total marks: 11]

A5 Hydrazine, N₂H₄, is used as rocket fuel. The equation for the combustion of hydrazine is as follows:

$$\text{N}_2\text{H}_4 (g) + \text{O}_2 (g) \rightarrow 2\text{H}_2\text{O} (g) + \text{N}_2 (g) \quad \Delta H = -622 \text{ kJ/mol}$$

(a) Explain, in terms of bond breaking and bond forming, why the above reaction is an exothermic reaction. [3]
(b) Draw the energy profile diagram, for the reaction between hydrazine and oxygen. Label clearly, the
- \( \Delta H \) of reaction,
- activation energy, \( E_a \)
- reactants and products.

(c) Hydrazine also undergoes another reaction with fluorine
\[ \text{N}_2\text{H}_4 (g) + 2 \text{F}_2 (g) \rightarrow 4 \text{HF} (g) + \text{N}_2 (g) \]

Use the following data to answer the question that follows:

<table>
<thead>
<tr>
<th>Bond</th>
<th>Bond Energy (kJ/mol)</th>
</tr>
</thead>
<tbody>
<tr>
<td>N – N</td>
<td>163</td>
</tr>
<tr>
<td>N – H</td>
<td>390</td>
</tr>
<tr>
<td>F – F</td>
<td>158</td>
</tr>
<tr>
<td>H – F</td>
<td>565</td>
</tr>
<tr>
<td>N ≡ N</td>
<td>945</td>
</tr>
</tbody>
</table>

Calculate the \( \Delta H \) for the reaction between hydrazine and fluorine.
(d) Hydrogen fluoride is a highly dangerous gas, forming corrosive and penetrating hydrofluoric acid upon contact with living tissue. The gas can also cause blindness by rapid destruction of the corneas.

(i) Hydrofluoric acid is a strong acid. Define the term strong acid. [1]

(ii) A student claims that hydrofluoric acid conducts electricity, therefore hydrogen fluoride is an ionic compound. Do you agree with the student? Explain your reasoning. [2]

CATHOLIC HIGH SCHOOL
Preliminary Examination
Secondary 4

CHEMISTRY
Paper 2

5073/2
16 September 2015
1 hour 45 minutes

READ THESE INSTRUCTIONS FIRST

Write your name, index number and class on all the work you hand in.
Write in dark blue or black pen.
You may use a soft pencil for any rough working. You may use a calculator.
Do not use staples, paper clips, highlighters, glue or correction fluid.
DO NOT WRITE ON THE MARGINS

Section B
Answer all questions in the foolscap paper provided.

For examiner’s use only:

Section B / 30

At the end of the examination, fasten all your work for each section securely together.
Hand in each section separately.
The number of marks is given in brackets [   ] at the end of each question or part question.

This document consists of 11 printed pages, including this cover page.
Page 12 has been intentionally left blank.

(Turn over)
Section B (30 marks)
Answer all three questions in this section. The last question is in the form of an either/or and only one of the alternatives should be attempted.

B6 Mass spectrometry is an important technique which can identify the amount and type of chemicals present in a sample by using a machine called a mass spectrometer. In general, the two quantities that can be measured are the mass/charge ratio (m/z) and the relative abundance of particles in the sample.

Mass/charge (m/z) ratio: this is calculated by dividing the mass of an ion by its charge. E.g. a sodium-23 ion, \( \text{Na}^+ \), would have a m/z value of 23. Hence, the m/z of an ion with a charge of 1+ is effectively its relative mass.

Relative abundance: this refers to the percentage of a particular isotope which occurs in nature. E.g. in a sample of chlorine, the relative abundance of chlorine-35 is 75% and chlorine-37 is 25%.

The steps below show how mass spectrometry is done:

**Step 1: Ionisation** – the sample is vapourised. Energy is then used to knock off one or more electrons from atoms or molecules in the sample, changing them into positive ions. If enough energy is supplied, some bonds of molecules are broken and smaller positive ions are formed.

**Step 2: Acceleration** – the ions formed from Step 1 are accelerated through the spectrometer by the use of negatively-charged plates.

**Step 3: Deflection and detection** – the ions are deflected by a magnetic field and are detected electrically.

**Step 4: Mass spectrum** – the mass spectrometer records the m/z and relative abundance of all ions in the form of a histogram, called a mass spectrum.

Figure 1 below shows the mass spectrum of a pure sample of lithium:

![Mass spectrum of a pure sample of lithium](image)

Additional information
It is known that all ions analysed in this sample have a charge of 1+.
Figure 2 below shows the mass spectrum of a pure sample of chlorine:

Relative abundance (%)

Additional information
It is known that all ions analysed in this sample have a charge of 1+.

Figure 2: Mass spectrum of a pure sample of chlorine

Figure 3 below shows the mass spectrum of a pure sample of an unknown hydrocarbon:

Relative abundance (%)

Additional information
It is known that all ions analysed in this sample have a charge of 1+.

Figure 3: Mass spectrum of a pure sample of an unknown hydrocarbon
Figure 1

(a)  (i) Explain how the data in Figure 1 shows that there are two isotopes of lithium. [2]

(ii) Show that the average relative atomic mass of lithium is 6.96 rounded off to 3 significant figures. Show your working clearly. [1]

Figure 2

(b)  (i) State the values of $x$ and $y$. [2]

(ii) There are only two known isotopes of chlorine, $Cl-35$ and $Cl-37$. Use the data in Figure 2 to suggest why there are 3 additional peaks of 70, $x$ and $y$ on the mass spectrum of chlorine. [2]
Figure 3

(c) (i) A student comments that the unknown hydrocarbon is propane. Explain how the data in Figure 3 shows that this is true.

(ii) Suggest the formula of the ion which has a m/z value of 14.

(iii) Another mass spectrometry analysis was carried out on a sample of butane. Suggest how the results of the mass spectrum of butane would differ from that of propane.

[Total marks: 12]
The table below provides some information on four organic compounds:

<table>
<thead>
<tr>
<th>Compound</th>
<th>Molecular formula</th>
<th>Decolourises brown aqueous bromine?</th>
<th>Turns moist blue litmus paper red?</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>C₂F₄</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>B</td>
<td>C₃H₆O₂</td>
<td>No</td>
<td>Yes</td>
</tr>
<tr>
<td>C</td>
<td>C₃H₆O₂</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>D</td>
<td>HO₂C - C₂H₄ - CO₂H</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>

(a) (i) Compound A can be polymerised to make polytetrafluoroethylene, also known as PTFE.

Draw the structure of PTFE.

(ii) There are high and low grades of PTFE. Molecules of high-grade PTFE typically have a relative molecular mass of $1.2 \times 10^6$.

Calculate how many repeat units there are in a typical molecule of high-grade PTFE. Show your working clearly.

(iii) Low-grade PTFE molecules typically have a relative molecular mass of $1.4 \times 10^4$.

Explain why low-grade PTFE has a lower melting point than high-grade PTFE.

(iv) Describe and explain a pollution problem caused by getting rid of substances made of PTFE.
(b) Compound B can react with another organic compound to form ethyl propanoate.

(i) Draw the structure of the organic compound which can react with B to form ethyl propanoate. [1]

(ii) Draw the structure of ethyl propanoate. [1]

(c) Compound C can be polymerised with Compound D. During this polymerisation process, small molecules of water are eliminated. Draw the structure of the polymer formed when C is polymerised with D, showing 2 repeat units. [Total marks: 8]
B8 This question concerns the chemistry of carbon and silicon, elements from Group IV of the Periodic Table. The table below provides some information on two different forms of carbon (allotropes) and silicon:

<table>
<thead>
<tr>
<th>Substance</th>
<th>Melting point / °C</th>
<th>Electrical conductivity</th>
<th>Uses</th>
</tr>
</thead>
<tbody>
<tr>
<td>Carbon allotrope A</td>
<td>Above 3000</td>
<td>Poor</td>
<td>Cutting tools, drill bits</td>
</tr>
<tr>
<td>Carbon allotrope B</td>
<td>Above 3000</td>
<td>Good</td>
<td>Lubricant</td>
</tr>
<tr>
<td>Silicon</td>
<td>1414</td>
<td>Good</td>
<td>Semiconductors in electronics</td>
</tr>
</tbody>
</table>

*Table 1: Some information on carbon and silicon*

(a) Carbon tends to form covalent compounds. By drawing the dot-and-cross diagram of a carbon compound of your choice, describe how a covalent bond is formed. You only need to show valence electrons.

(b) Explain, in terms of bonding, why carbon allotrope A can be used as a drill bit while carbon allotrope B can be used as a lubricant.
(c) Carbon is commonly used as a reducing agent. For example, it can reduce zinc oxide to form zinc. Explain, using oxidation states, how carbon is acting as a reducing agent in the reduction of zinc oxide.

(d) Silicon has the structure shown below:

![Figure 4: Structure of silicon]

Legend:
- represents a silicon atom

This structure of silicon in Figure 4 above alone is unable to account for one of its physical properties stated in Table 1. State this physical property and explain why.

(e) Silicon reacts with oxygen to form silicon dioxide. Describe one similarity and one difference between the structures of silicon and silicon dioxide.

[Total marks: 10]
This question concerns the chemistry of some elements in Group II of the Periodic Table.

(a) Magnesium is in Group II of the Periodic Table. It tends to form ionic compounds. By drawing the dot-and-cross diagram of a magnesium compound of your choice, describe how an ionic bond is formed. You only need to show valence electrons.

(b) Magnesium reacts with oxygen to form magnesium oxide.

(i) In terms of bonding, “strong electrostatic forces of attraction” exist in both solid magnesium and solid magnesium oxide, but different kinds of particles are involved. State these particles.

(ii) Both solid magnesium and molten magnesium oxide conduct electricity differently. Explain how solid magnesium conducts electricity differently from molten magnesium oxide.
(c) Both magnesium and calcium metals are reducing agents. Some chemical reactions show that calcium is a stronger reducing agent than magnesium. Write a single, chemical equation to represent one such reaction.

(d) The table below provides some information on some salts of Group II elements:

<table>
<thead>
<tr>
<th>Name of salt</th>
<th>Solubility (maximum grams dissolved in 100 cm$^3$ of water at r.t.p)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Magnesium sulfate</td>
<td>35.1</td>
</tr>
<tr>
<td>Calcium sulfate</td>
<td>0.21</td>
</tr>
<tr>
<td>Barium sulfate</td>
<td>$2.45 \times 10^{-4}$</td>
</tr>
<tr>
<td>Radium sulfate</td>
<td>?</td>
</tr>
</tbody>
</table>

From the information given in the table above, suggest how you would prepare a pure, dry sample of radium sulfate. Name the starting reagents in your answer.

<td></td>
</tr>
</tbody>
</table>

Solution will turn from blue to colourless [1] Copper ions are preferentially discharged from the solution [1]

(c) Silver anode will dissolve compared to zinc; effervescence seen at the anode [1] Silver anode is a reactive electrode compared to inert carbon electrode [1]

A3a | Markings must be shown |
| 11 C | 12 C | 2HCl(aq) + Zn(s) → ZnCl₂(aq) + H₂(g) | -1 mark for no state symbol No marks for wrongly balanced equation |
(c) 

\[ \text{Volume of gas} / \text{cm}^3 \]

\begin{align*}
\text{Experiment 1} & : Y = 30.0 \text{ cm}^3 \\
\text{Experiment 2} & : Z = 0.25 \text{ mo} / \text{dm}^3 \\
\text{Experiment 3} & : Y = 60.0 \text{ cm}^3 \\
\text{Z} & = 0.125 \text{ mo} / \text{dm}^3
\end{align*}

(d) 

\( Y = 30.0 \text{ cm}^3 \)

\( Z = 0.25 \text{ mo} / \text{dm}^3 \)

Or

\( Y = 60.0 \text{ cm}^3 \)

\( Z = 0.125 \text{ mo} / \text{dm}^3 \)

(e) 

Increase in temperature increases the kinetic energy of the particles \( [1] \). More particles have greater energy or equal to the activation energy \( [2] \). Higher frequency of effective collision \( [1] \) increases speed of reaction.

A4a A,C,D,E

b) Metal A. No visible observation \( [1] \)

Metal D: Metal D dissolves/brown solution becomes colourless/Grey solid produced (Any 2 for 2 marks)

(b) \( \text{Fe}_2\text{O}_3(s) + 3\text{CO}(g) \rightarrow 3\text{CO}_2(g) + 2\text{Fe}(l) \)

-1 mark if no state symbols

(d) Oxygen and water

React air

(f) Sacrificial Protection: A more reactive metal like magnesium or zinc can be placed beside iron \( [1] \). It will corrode in place of iron \( [1] \)

A5a Bond energy absorbed to break the bonds of \( \text{NH}_3 \) and \( \text{O}_2 \) \( [1] \) is lesser \( [1] \) than the energy released for the bond formation of \( \text{H}_2\text{O} \) and \( \text{N}_2 \) \( [1] \)

(c) 

1m - Shape of the graph

2m - For enthalpy change, activation energy and correct reactants and products. (1m if one or two is missing)

Arrow wrong = wrong

\( \text{Energy absorbed = 163} + 390 \text{(J)} \)

\( + 158 \text{(J)} \)

\( = 209 \text{(J)} \)

\( \text{Energy released = 3205 (J)} + 945 \text{(J)} \)

\( = 3205 \text{(J)} \)

\( \Delta H = 2039 - 3205 \text{ (J)} \)

\( = -1161 \text{ (J/mol)} \)

(d) A strong acid is an acid that dissociates completely in water to produce \( \text{H}^+ \) ions

(i) The statement is false. Hydrogen fluoride is made up of non-metals \( [1] \). Therefore, it is a covalent compound \( [1] \)

<td></td>
</tr>
</tbody>
</table>

**EITHER**

8a) Any appropriate compound 1 mark for correct number of electrons on carbon atom 1 mark for correct number of electrons on the other atom(s) Explanation, the carbon atom and X atom share a pair of electrons to attain a noble gas electronic configuration [1] 0 marks for ionic compound

b) In silicoprop A, every carbon atom is bonded to 4 other carbon atoms by strong covalent bonds. This makes the whole structure very hard. In silicoprop B, every carbon atom is bonded to 3 other carbon atoms in hexagonal layers. Little force is needed to overcome these weak intermolecular forces of attraction between layers, making B slippery.

c) Carbon causes the oxidation state of zinc to decrease from +2 in ZnO to 0 in Zn₂O₃, hence reducing zinc oxide.

d) Good electrical conductivity [1]. Every carbon atom is bonded to 4 other carbon atoms, all valence electrons are used in bonding and there appears to be no mobile delocalised electrons or ions.

e) Similarly, both silicon and silicon dioxide have giant covalent lattice [1] structures. Difference: the structure of silicon only involves silicon atoms while there are silicon and oxygen atoms present in silicon dioxide [1].
<table>

Key:
- a = diagonal jumps
- b = periods
- X = modern symbol
- X = obsolete symbol

- 40-71 lanthanoid series
- 90-103 actinoid series
1 Ethylamine gas, $\text{C}_2\text{H}_5\text{NH}_3$, and hydrogen chloride gas, $\text{HCl}$, react together to form a white solid, ethylamino hydrochloride.

At which position in the tube would a ring of solid ethylamino hydrochloride form?

- A
- B
- C
- D

- cotton wool soaked in ethylamine solution
- cotton wool soaked in hydrochloric acid

2 Amino acids are colourless and can be separated and identified by chromatography as shown.

- glass cover
- beaker
- solvent
- chromatography paper

What additional apparatus and/or chemical labare required to calculate the $R_f$ value of the amino acids present in a mixture?

A a ruler
B a locating agent
C a ruler and a locating agent
D neither a ruler nor a locating agent

3 In which pair do neither of the gases change the colour of moist blue litmus paper?

A ammonia and hydrogen
B ammonia and hydrogen chloride
C carbon dioxide and chlorine
D carbon dioxide and sulfur dioxide

4 The scheme shows a sequence of reactions starting from compound Y.

- compound Y
- excess $\text{HNO}_3$(aq)
- colourless solution
- NaOH(aq)
- white precipitate insoluble in excess NaOH(aq)

What could compound Y be?

A aluminium hydrogencarbonate
B calcium carbonate
C copper(II) carbonate
D zinc carbonate

5 The apparatus shown can be used to find the rate of some chemical reactions.

- The rate of which reaction can be followed using this apparatus?

A $\text{Mg} + \text{HCl}$
B $\text{AgNO}_3 + \text{KI}$
C $\text{NaOH} + \text{HCl}$
D $\text{NaOH} + \text{CuSO}_4$
6 Naturally-occurring bromine has a relative atomic mass of 80 and consists entirely of two isotopes of relative atomic masses 79 and 81.

What can be deduced about naturally-occurring bromine from this information only?

A Bromine is radioactive
B Bromine has different oxidation states
C Bromine isotopes have different number of protons
D Bromine contains the two isotopes in equal proportions.

7 An ion X²⁻ has m nucleons and n electrons.

What does the nucleus of an atom X contain?

<table>

<td>2852</td>
<td>3800</td>
</tr>
<tr>
<td>Al₂O₃</td>
<td>2072</td>
<td>2800</td>
</tr>
</tbody>
</table>

Over which temperature range will both pure compounds conduct electricity?

A 25 °C to 2852 °C
B 2072 °C to 2852 °C
C 2852 °C to 2880 °C
D 2880 °C to 3800 °C

9 The structure of metals consists of positive ions in a 'sea' of electrons.

Which statement correctly describes what happens to the particles in the metallic heating element of an electric kettle when the kettle is switched on?

A Electrons move in both directions in the element.
B Electrons move in one direction only in the element.
C Positive ions move in one direction only in the element.
D Electrons move in one direction and positive ions move in the opposite direction in the element.

10 In the lattice structure of ionic compounds, coordination number is the number of nearest neighbour ions of opposite charge. For instance, in sodium chloride, each Na⁺ ion is surrounded by 6 Cl⁻ ions and each Cl⁻ ion is surrounded by 6 Na⁺ ions. Therefore, coordination number of Na⁺ and Cl⁻ ions is 6.

The table below shows the ions present and the coordination number of the ions in some ionic compounds.

<table>

What is the formula of compound P?

A QR₂
B QR₆
C QR₄
D QR₆

11 Silicon carbide, SiC, has a structure similar to diamond. Boron nitride, BN, has a structure similar to graphite. Bronze is an alloy of copper and tin.

Which statements about SiC, BN and bronze are correct?

1 All are bonded covalently.
2 All have high melting and boiling point.
3 All except bronze are soluble in organic solvents.
4 All except silicon carbide conduct electricity when solid.

A 1 and 2
B 2 and 3
C 2 and 4
D 3 and 4

12 One volume of gaseous element X₂ reacts with an equal volume of gaseous hydrogen to form two volumes of a gaseous hydride.

What is the formula for the hydride of X?

A HX
B H₂X
C H₂X₂
D H₂X₃
13 The diagram shows the structures of the atoms of elements Y and Z.

Elements Y and Z react to form a compound.

What is the mass of one mole of this compound?

14 An equal number of moles of two chemical compounds, R and S, are given.

The chemical formulas of these two substances, R and S, are shown below:

- R: NaAlSi₃O₈
- S: CaAl₂Si₂O₈

Which statements are incorrect?

1. R and S contain the same number of moles of oxygen.
2. Both R and S have the same percentage by mass of oxygen.
3. The percentage by mass of aluminium in S is twice the percentage by mass of aluminium in R.

18. The change in energy during a reaction is represented in the following energy profile diagram.

\[ \text{Energy / kJ} \]

\[ \text{Reactant} \rightarrow Y \rightarrow \text{Product} \]

What does \( Y \) represent?

A. the enthalpy change for the forward reaction
B. the activation energy of the forward reaction
C. the activation energy for the reverse reaction
D. the energy released to form the bonds in the products for the reverse reaction

19. Solutions of hydrochloric acid, \( \text{HCl} \), and ethanoic acid, \( \text{CH}_3\text{COOH} \), of the same concentration react completely with 5.0 g of calcium carbonate, \( \text{CaCO}_3 \), in separate containers.

Which statement is correct?

A. \( \text{CH}_3\text{COOH} \) reacts slower because it has a lower pH than \( \text{HCl} \)
B. A smaller volume of \( \text{CO}_2 \) is produced with \( \text{CH}_3\text{COOH} \) than with \( \text{HCl} \)
C. A greater volume of \( \text{CO}_2 \) is produced with \( \text{CH}_3\text{COOH} \) than with \( \text{HCl} \)
D. The same volume of \( \text{CO}_2 \) is produced with both \( \text{CH}_3\text{COOH} \) and \( \text{HCl} \)

20. In which reaction does a single nitrogen atom have the greatest change in oxidation number?

A. \( 2\text{NO} + \text{O}_2 \rightarrow 2\text{NO}_2 \)
B. \( 4\text{NH}_3 + 5\text{O}_2 \rightarrow 4\text{NO} + 6\text{H}_2\text{O} \)
C. \( 4\text{NH}_3 + 6\text{NO} \rightarrow 5\text{N}_2 + 6\text{H}_2\text{O} \)
D. \( 3\text{NO}_2 + \text{H}_2\text{O} \rightarrow 2\text{HNO}_2 + \text{NO} \)

21. Three electrolytic cells are set up. Each cell uses inert electrodes. The electrolytes used for each cell are shown in the table below.

<table>
<thead>
<tr>
<th>Cell</th>
<th>Electrolyte</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Concentrated silver chloride solution</td>
</tr>
<tr>
<td>2</td>
<td>Molten sodium iodide</td>
</tr>
<tr>
<td>3</td>
<td>Dilute nitric acid solution</td>
</tr>
</tbody>
</table>

In which cell is a gas formed at both electrodes?

A. 1 and 2
B. 1 and 3
C. 2 only
D. 3 only

22. The diagram shows the electrolysis of molten lead(II) bromide using inert electrodes.

What happens during this electrolysis?

A. Ions change to atoms
B. Atoms change to ions
C. Covalent bonds are broken
D. New compounds are formed
The dissociation constant ($K_a$) for a base indicates the extent to which it dissociates into ions in water. The higher the dissociation constant ($K_a$), the higher the strength of the base.

Generally, compounds from amines homologous series form weak bases when dissolved in water. For instance, when methylamine is added to water, it loses partially into methylammonium ion and hydroxide ion as shown in the equation below:

$$\text{CH}_3\text{NH}_2(\text{aq}) + \text{H}_2\text{O}(\ell) \rightarrow \text{CH}_3\text{NH}_3^+(\text{aq}) + \text{OH}^- (\text{aq})$$

The dissociation constant ($K_a$) and full structural formula for the first four members of the amine homologous series are given in the table below:

<table>
<thead>
<tr>
<th>amine</th>
<th>full structural formula</th>
<th>dissociation constant ($K_a$)</th>
</tr>
</thead>
<tbody>
<tr>
<td>methylamine</td>
<td>$\text{H} - \text{C} - \text{N} \bigg</td>
<td>\text{H}$</td>
</tr>
<tr>
<td>ethylamine</td>
<td>$\text{H} - \text{C} - \text{C} - \text{H}$</td>
<td>$4.5 \times 10^{-4}$</td>
</tr>
<tr>
<td>propylamine</td>
<td>$\text{H} \bigg</td>
<td>\text{C} \bigg</td>
</tr>
<tr>
<td>butylamine</td>
<td>$\text{H} \bigg</td>
<td>\text{C} \bigg</td>
</tr>
</tbody>
</table>

Based on the data above, which statement is correct?

A. Aqueous methylamine turns Universal Indicator from green to yellow
B. Increasing the length of carbon chain increases the strength of the base
C. There are more undissociated molecules in a solution of butylamine than that in ethylamine of same concentration.
D. Given that the $K_a$ of ammonia = $1 \times 10^{-5}$, there is a higher concentration of OH" ions in ammonia solution than that in propylamine of the same concentration.

Three oxides are added separately to aqueous barium hydroxide

1. lead(II) oxide
2. nitrogen monoxide
3. silicon dioxide

Candidates answer on the Question Paper.

No Additional Materials are required.

READ THESE INSTRUCTIONS FIRST

Write your name, index number and class on all the work you hand in.
Write in dark blue or black pen.
You may use a pencil for any diagrams or graphs.
All final answers for calculations are to be rounded off to 3 significant figures.
Do not use staples, paper clips, highlighters, and glue or correction fluid.

Section A (50 Marks)
Answer ALL questions in the spaces provided.

Section B (30 Marks)
Answer all THREE questions from this section. The last question is in the form of EITHER/OR and only ONE of the alternatives should be attempted.
Answer ALL questions in the spaces provided.

The number of marks is given in brackets [ ] at the end of each question or part question.
A copy of the Periodic Table is printed on page 17.

The use of an approved scientific calculator is expected, where appropriate.

Use the information from the table to answer the following questions.

(a) Which element has the highest tendency to gain electrons? Explain your answer. [2]

(b) (i) Draw a ‘dot and cross’ diagram to show the bonding in Y₂O. [2]
Show the valence electrons only.
A1  (b)  (ii) Predict the electrical conductivity of Y₂O in the solid state. Explain your answer.  

(c) Arrange the elements W, X, Y, Z in order of increasing proton numbers  

[Total: 8 marks]

A2  (a) During a chemistry experiment, a student added 1.00 g of calcium metal to 25.0 cm³ of 1.50 mol/dm³ of nitric acid. The gas evolved from the reaction was collected and measured over fixed intervals until the reaction is completed.

Calculate the total volume of gas expected to be collected at the end of the reaction.
A2  (b) At the end of the experiment, a graph of volume of gas collected against time was plotted and shown below.

![Graph of Volume of Gas vs. Time](image)

Suggest a reason for the difference between the actual volume of gas obtained and the theoretical volume calculated in (a). [1]

(c) The student intends to repeat the experiment using sulfuric acid. Other than mass, suggest one other important factor regarding the metal reagent that needs to be kept constant in order to ensure that a fair second experiment was conducted.

Explain your answer. [2]

(d) Given that the volume and concentration of acid and mass of calcium metal used for the second experiment is kept the same as the first experiment, sketch the expected graph on the same axes and label the graph as (d).

(e) Explain the shape of your graph in (d). [3]

[Total: 11 marks]
A3. The Ostwald Process is a chemical process for manufacturing nitric acid, HNO₃. It is done via two stages.

The chemical equation below illustrates the redox reaction that occurs in Stage One.

Stage One: \(4 \text{NH}_3 (g) + 5 \text{O}_2 (g) \rightarrow 4 \text{NO (g)} + 6 \text{H}_2 \text{O (g)}\) \(\Delta H = -905.2 \text{ kJ}\)

(a) Draw an energy profile diagram for the reaction above, indicating the enthalpy change and activation energy clearly.

(b) In terms of oxidation states, explain why the reaction in Stage One is a redox reaction.

Stage Two consists of two steps.

Step 1: \(2 \text{NO (g)} + \text{O}_2 (g) \rightarrow 2 \text{NO}_2 (g)\)

In Step 2, \(\text{NO}_2\) produced in Step 1 is absorbed by water readily to form dilute nitric acid as well as nitrogen monoxide, which is recycled to be used in Step 1.

(c) (i) Write a balanced chemical equation to show the reaction in Step 2.

(ii) Name a physical process that can be carried out to increase the concentration of the dilute nitric acid that is obtained at the end of Stage 2.
A3 (c) (iii) Explain why it is important that the product in Step 1 of Stage Two does not escape into the atmosphere. [2]

A4 The diagram below shows an experimental set-up of two electrochemical cells

![Diagram of two electrochemical cells](image)

Both electrodes X and Y are made of graphite.

(a) Identify the positive terminals of both electrochemical cells and write the equations to illustrate the reactions happening at the electrodes. Include state symbols.

<table>
<thead>
<tr>

(b) (i) What is the expected ratio of the volume of the gases obtained at electrodes X and Y? [2]

Explain your answer with appropriate equation(s). Include state symbols.
A4  (b)  (ii) Suggest a possible reason why the ratio of the volume of the gases may not 
be the same as what was expected in (b)(i) [1]

[caption]

(c) What is the colour observed in the electrolyte of Cell Two when the circuit has 
been switched on for a period of time? [2]

Explain your answer.

[caption]

[Total: 8 marks]

A5  (a)  (i) An organic compound J contains 40.0% of carbon, 53.3% of oxygen and  
6.7% of hydrogen. [3]

Calculate the empirical formula of the compound.

(ii) The relative molecular mass of the compound is 90. [2]

What is the molecular formula of the compound J?
The diagram below shows some information related to compound J.

(i) **Reaction I** is known as a *hydration* reaction. State the conditions required for the reaction to take place. [1]

(ii) Identify Gas R and the functional group present in compound J that allows **Reaction II** to occur. [2]

(iii) Compound J has an isomer. [2]

Using the information in (a) and the diagram above, deduce and draw the full structural formulae of compound J and its isomer.
(c) (i) One of the isomers of compound J can undergo condensation polymerisation.

Define the term 'condensation polymerisation'.

(ii) Draw the structure of the polymer formed when compound J undergoes condensation polymerisation. Show at least two repeating units.

(d) (i) What type of polymerisation can compound G undergo?

(ii) Draw the structure of the polymer of compound G. Show at least two repeating units.

[Total: 14 marks]
Section B (30 Marks)

Answer all three questions in this section.

The last question is in the form of an either/or and only one of the alternatives should be attempted

B6 Read the information below about titanium and answer the questions.

Titanium is a metal that is higher than carbon in the reactivity series. However, it is not extracted by electrolysis. It is extracted from rutile, which contains 50% titanium(IV) oxide. Although titanium is the 10th most common occurring element in the Earth's crust, it is a very expensive metal.

The flowchart below shows the extraction of titanium.

Step 1: Titanium(IV) oxide (TiO₂) is reacted with chlorine and coke at 1000 °C to produce titanium(IV) chloride (TiCl₄) and carbon monoxide. Titanium(IV) chloride is cooled and collected.

Step 2: Titanium(IV) chloride from Step 1 is reacted with magnesium at a temperature of 1100°C in a sealed reactor for 3 days to obtain titanium. The sealed reactor contains an atmosphere of argon.

Step 3: The reactor is allowed to cool. The reactor is opened and the titanium is separated from the other product, magnesium chloride.

(a) Titanium(IV) chloride that is produced in Step 1 exists as a colourless liquid at room temperature and boils at 136°C.

(i) Based on the information given, deduce the structure and bonding present in titanium(IV) chloride. Explain your answer.

(ii) What is unusual about the bonding present in titanium(IV) chloride? Briefly explain your answer.
B6  (a) (iii) Hence, suggest a possible reason why electrolysis of titanium(IV) chloride is not used as a method to extract titanium. [2]

(b) (i) Write a balanced chemical equation to show the reaction that took place in Step 1 to convert titanium(IV) oxide to titanium(IV) chloride. [1]

(ii) State an health effect of the product(s) produced in this reaction. [1]

(c) (i) Write a balanced chemical equation to show the reaction that took place in Step 2. [1]

(ii) Name the type of reaction that has occurred. [1]

(iii) Suggest a reason why an argon atmosphere is necessary in this process. [1]

(iv) Based on the information given above, deduce why titanium is expensive despite its abundance in the Earth's crust. [2]

[Total: 12 marks]
(a) You are given two 1.0 mol/dm$^3$ of strong acids A and B, which have different basicity. One is monobasic while the other is dibasic.

(i) Give an example of a monobasic acid and dibasic acid. [1]

<table>
<thead>
<tr>
<th>Monobasic acid</th>
<th>Dibasic acid</th>
</tr>
</thead>
</table>

(ii) Using your answer in (a)(i) as example, state and explain the difference in electrical conductivity, if any, between monobasic and dibasic acids [2]

(iii) Using your answer in (a)(i) as example, briefly describe and explain an experiment to distinguish two given samples of a monobasic and dibasic acid using a solution of 1.0 mol/dm$^3$ of aqueous NaOH. [3]

(b) Aqueous solutions of chlorine and iodine are added separately to two test tubes each containing a solution of iron(II) ions. Aqueous sodium hydroxide is then added to each test tube. The results are given in the table below.

<table>
<thead>
<tr>
<th>Addition of aqueous $Cl_2$</th>

**Periodic Table of the Elements**

- **Periods**: The horizontal rows of the table represent periods, which correspond to energy levels of electrons in atoms.
- **Groups**: The vertical columns of the table represent groups, which are based on the number of valence electrons.
- **Elements**: The table lists elements from the periodic table, arranged by atomic number, with each element's symbol, atomic number, atomic weight, and other properties.
A1 (a) Element W

W forms an acidic oxide and W is a non-metal which tends to gain electrons

(b) NO
WO$_2$ has a low melting point and boiling point indicating it is a simple covalent compound which is usually formed by non-metals

A2 (a) $\text{Ca} + \text{2HNO}_3 \rightarrow \text{Ca(NO}_3)_2 + \text{H}_2$

- No. of moles of acid = $\frac{230}{63}$ = 3.63 moles
- No of moles of Ca = $\frac{40}{40}$ = 0.025 moles
- 0.025 moles of Ca requires 0.05 moles of acid
- Hence acid is the limiting reagent.
- Number of moles of H$_2$ = $\frac{3.63}{2}$ = 0.01875 moles
- Volume of H$_2$ = 0.01875 x 22.4 = 0.45 dm$^3$ or 450 cm$^3$

(b) Calcium is a reactive metal and hence it can react with water as well to form aq. calcium hydroxide and hydrogen gas

(c) Particle size/surface area of M must be the same as the surface area affects the speed of reaction

The larger the surface area, the larger the area of contact between reactant particles and hence faster the reaction.

A3 (e) Energy/J

- $\text{NO}_2 (g) + \text{O}_2 (g) \rightarrow \text{2NO}_3 (g)$
- $\Delta H = -495$ kJ

(b) The oxidation state of N of NH$_3$ increases from -3 to +2 in NO

The oxidation state of O in O$_2$ decreases from 0 to -2 in NO

(c) (i) $3\text{NO}_2 + \text{H}_2\text{O} \rightarrow 2\text{HNO}_3 + \text{NO}$

(ii) Distillation

(iii) NO$_2$ is an acidic oxide and dissolves in water readily to form acid rain which corrodes metal structures and limestone buildings/damages crops due to low pH of soil.
A4 (a) 

<table>
<thead>
<tr>
<th>Positive Terminal</th>
<th>Half-equation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cell One</td>
<td>Silver $\checkmark$ $\text{Ag}^+ (aq) + e^- \rightarrow \text{Ag}(s)$ $\checkmark$</td>
</tr>
<tr>
<td>Cell Two</td>
<td>$\checkmark$ $\text{2Cl}^- (aq) \rightarrow \text{Cl}_2 (g) + 2e^-$ $\checkmark$</td>
</tr>
</tbody>
</table>

(b) (i) Equation 1: $\text{2Cl}^- (aq) \rightarrow \text{Cl}_2 (g) + 2e^-$

Equation 2: $\text{2H}^+ (aq) + 2e^- \rightarrow \text{H}_2 (g)$

OR

$\text{2Cl}^- (aq) + \text{2H}^+ (aq) \rightarrow \text{H}_2 (g) + \text{Cl}_2 (g)$

From the equations, $1\text{Cl}_2 = 2e^-; 1\text{H}_2 = 2e^-$. Hence, when 1 mole of $\text{Cl}_2$ is formed, 2 moles of electrons are lost and accepted by $\text{H}^+$ ions to form one mole of $\text{H}_2$.

Hence, the expected ratio of $\text{H}_2$ to $\text{Cl}_2$ formed is 1:1.

(ii) This is because chlorine is more soluble in water than hydrogen; chlorine is very soluble in water while hydrogen gas is insoluble in water. The volume of $\text{Cl}_2$ collected may be lower than expected, resulting in a different ratio.

(c) Violet/Purple solution obtained because when $\text{H}^+$ and $\text{Cl}^-$ ions are discharged, the $\text{OH}^-$ ions left behind are at a high concentration; the $\text{OH}^-$ ions form a strong alkali with $\text{K}^+$ ions.

The solution turned colourless due to the bleaching by the $\text{Cl}_2$ gas dissolving in the solution.

A5 (a) (i)

The empirical formula is $\text{CH}_2\text{O}$

(i) Molar mass of $\text{CH}_2\text{O} = 12 + 2 + 16 = 30 \text{ g/mol}$

$n(\text{CH}_2\text{O}) = 90$

$n = 3$

Molecular formula $= \text{C}_9\text{H}_3\text{O}_3$.

(b) (i) $300 \degree \text{C}, 60 \text{ atm}; \text{Phosphoric acid (H}_3\text{PO}_4)$

(i) $\text{CO}_2$ gas

Carboxyl / -COOH functional group
Section B

B6 (a) (i) As titanium(IV) chloride exists as a liquid at room temperature and pressure and boils at 128°C, it has a low melting and boiling point. Hence, it should exist as a simple covalent compound, with weak intermolecular forces between its molecules.

(ii) No, titanium is a metal and hence usually forms ionic compounds with chlorine (a non-metal). But titanium(IV) chloride is a covalent compound.

(iii) Since titanium(IV) chloride is a covalent compound, thus it cannot conduct electricity at any state since it does not have any mobile ions or free moving electrons.

(b) (i) TiO₂ + 2Cl₂ + 2C → TiCl₄ + 2CO

(ii) CO is a poisonous gas as it combines with haemoglobin to form a compound which prevents oxygen gas from being transported to the rest of the body, causing respiratory difficulties.

(c) (i) TiCl₄ + 2Mg → Ti + 2MgCl₂

(ii) Metal displacement/redox reaction

(iii) To provide an inert atmosphere to prevent magnesium from reacting with air since it is a reactive metal

(iv) The extraction of titanium requires the use of magnesium which is a reactive metal and requires electrolysis to be extracted.

Alternative answer accepted;

The process requires the use of aragonite which is obtained from fractional distillation of liquid air and large amount of fossil fuels is required in order to maintain the high temperature required.

B7 (a) (i) Monobasic – Hydrochloric acid

(ii) Dibasic – Sulfuric acid

(iii) The electrical conductivity of the (dibasic acid) will be higher than the (monobasic acid) because

1 mole of (monobasic acid) dissociates to give 2 moles of mobile ions (H⁺ and X⁻) while

1 mole of dibasic acid dissociates to give 3 moles of mobile ions (2H⁺ and Y⁻)

Hence, there is higher number of mobile ions present in the dibasic acid when it dissociates.

(iii) Titrate and

B8 EITHER

(a) Differences in boiling point

(b) (i) Iron(III) hydride

(ii) The precipitate is insoluble in excess aqueous NaOH.

(iii) Aqueous chlorine was able to oxidise Fe²⁺ solution to Fe³⁺ solution while iodine was unable to do so.

(i.e.) Chlorine is a stronger oxidizing agent than iodine.

C₂H₄ (aq) + 2Fe²⁺ (aq) → 2Fe³⁺ (aq) + 2CH₂ (aq)

B8 OR

(a) C₆H₁₂O₂

(b) (i) Iron(III) hydride

(ii) The precipitate is insoluble in excess aqueous NaOH.

(iii) Aqueous chlorine was able to oxidise Fe²⁺ solution to Fe³⁺ solution while iodine was unable to do so.

(i.e.) Chlorine is a stronger oxidizing agent than iodine.

C₂H₄ (aq) + 2Fe²⁺ (aq) → 2Fe³⁺ (aq) + 2CH₂ (aq)

Since both acids have the same concentration,

the volume of the NaOH required for complete neutralization of dibasic acid will be twice than that of the monobasic acid as the mole ratio between NaOH + HCl = 1:1 while the mole ratio of NaOH + H₂SO₄ = 2:1.

(b) (i) Titrate and
(b) The boiling points **increase** down the homologous series
As the molecules get bigger,
the *van der waals'* forces of attraction between molecules get **stronger**.
Intermolecular forces get **stronger**.
Larger amount of energy required to overcome them and hence boiling points increase.

(c) The enthalpy change of combustion **becomes more negative** as the carbon chain increases down the homologous series.
As the carbon chain increases, greater amount of energy is released to form the greater no. of moles of products (CO₂ and H₂O) formed.

(d) (i) 1 mol of propyne releases 1466 kJ of energy
1 mol of propane → 40 g

1 e 40 g of propyne releases 1466 kJ of energy
amount of energy released by 1 g of propyne = \( \frac{1466}{40} = 36.7 \) kJ
Hence, hydrogen has a greater energy output.

(ii) As particles in the liquid state are closely packed together, more molecules of the fuel can be stored in the same volume of space when transported in liquid state as compared to gaseous state.

**OR**
Fuel in the gaseous form is more **explosive** than when it is in its liquid form as gaseous particles contains more kinetic energy than liquid particles.
1. There are two unlabelled bottles, one of which is hydrochloric acid and the other is sulfuric acid. To distinguish the two acids, a student adds aqueous sodium hydroxide to each of the acids.

   Given that the concentration of the solutions used are the same, which of the following apparatus would not be necessary in this investigation?

   A. beaker  
   B. measuring cylinder  
   C. stop watch  
   D. thermometer

2. The following diagram shows a method to collect a sample of gas Y.

   ![Diagram showing a method to collect gas Y](image)

   Which of the following information can be deduced about gas Y?

   1. Y is alkaline.
   2. Y is very soluble in water.
   3. Y is less dense than air.

   A. 1, 2 and 3  
   B. 1 and 2  
   C. 3 only  
   D. None of the above

3. Which set of results is correct when the reagent is added to a solution containing both iron(II) sulfate and sodium nitrate?

4. A mixture containing equal volumes of two liquids is placed in the apparatus shown and heated until the thermometer first shows a constant reading. At which position will there be the highest proportion of the liquid with the higher boiling point?

5. Aqueous lead(II) nitrate and aqueous potassium bromide are added to a dish containing water, as shown.

A precipitate forms after a few minutes. Which of the following statements explains the phenomenon?

- A: Particles collide, diffuse, and then react.
- B: Particles collide, react, then diffuse.
- C: Particles diffuse, collide, and then react.
- D: Particles diffuse, react, then collide.

6. The isotope cobalt-60 is used to destroy cancer cells in the human body. Which of the following statements about an atom of cobalt-60 are correct?

- It contains 38 neutrons.
- Its nucleus has 27 positive charges.
- It has a different number of neutrons from some atoms of cobalt.

A: 1 and 2
B: 1 and 3
C: 2 and 3
D: All of the above

7. The diagram shows the molecule propyl methanoate.

What is the total number of electrons that are not involved in the bonding in the molecule?

A: 8
B: 12
C: 20
D: 28

8. Which of the following solids has both ionic and covalent bonds?

- A: ammonium sulfate
- B: iodine
- C: silicon dioxide
- D: steel

9. The two statements are about chlorine. The statements may or may not be correct. They may or may not be linked.

- Statement 1: Chlorine has weak covalent bonds in its simple molecular structure.
- Statement 2: Chlorine is soluble in water.

What is correct about these two statements?

- A: Both statements are correct and statement 1 explains statement 2.
- B: Both statements are correct but statement 1 does not explain statement 2.
- C: Statement 2 is correct but statement 1 is incorrect.
- D: Both statements are incorrect.
10 On collision, airbags in cars inflate rapidly due to the production of nitrogen. The nitrogen is formed in two steps as shown below

Step 1: \[ 2\text{Na}_2\text{O} \rightarrow 2\text{Na} + 2\text{N}_2 \]
Step 2: \[ 10\text{Na} + 2\text{K}_2\text{O}_3 \rightarrow 2\text{K}_2\text{O} + 5\text{Na}_2\text{O}_3 + \text{N}_2 \]

How many moles of nitrogen gas are produced from 1 mole of sodium oxide, \( \text{Na}_2\text{O} \)?

- A 1 mol
- B 1.6 mol
- C 2 mol
- D 4 mol

11 Dinitrogen tetroxide, \( \text{N}_2\text{O}_4 \), is a poisonous gas. It can be disposed of safely by reaction with sodium hydroxide

\[ \text{N}_2\text{O}_4(aq) + 2\text{NaOH}(aq) \rightarrow \text{Na}_2\text{NO}_2(aq) + \text{NaNO}_2(aq) + \text{H}_2\text{O}(l) \]

What is the minimum volume of 0.5 \( \text{mol dm}^{-3} \) sodium hydroxide needed to dispose of 1.84 g of dinitrogen tetroxide?

- A 40 cm\(^3\)
- B 80 cm\(^3\)
- C 1250 cm\(^3\)
- D 6500 cm\(^3\)

12 Bone is a saturated solution of sodium chloride. In the electrolysis of brine, the products are chlorine, hydrogen and sodium hydroxide.

What is the maximum yield of each of these products when 58.5 kg of sodium chloride are electrolysed as shown?

13 Consider the following reaction for which the heat of reaction is given

\[ 2\text{N}_2\text{O}_4(s) \rightarrow 4\text{N}_2(g) + 5\text{O}_2(g) \]

\[ \Delta H = -23 \text{kJ/mol} \]

Which of the following statements about the reaction is not correct?

A For each mole of \( \text{N}_2\text{O}_4 \) reacted, 11.5 kJ of heat is released.
B For 2 moles of \( \text{N}_2 \) produced, 11.5 kJ of heat is released.
C The energy of \( \text{N}_2 \) is less than that of the products.
D The energy involved in bond breaking is greater than that of bond breaking.

14 The two statements are about electrolysis of concentrated aqueous potassium nitrate using graphite electrodes. The statements may or may not be correct. They may or may not be linked.

statement 1 The solution around anode turned litmus rod during electrolysis.
statement 2 Hydroxide ions are discharged at the anode during electrolysis.

Which is correct about the two statements?

- A Both statements are correct and statement 1 explains statement 2.
- B Both statements are correct but statement 2 does not explain statement 1.
- C Statement 2 is correct but statement 1 is incorrect.
- D Both statements are incorrect.

15 In the extraction of aluminium by electrolysis using graphite electrodes, molten aluminium oxide is dissolved in molten cryolite which is a salt.

statement 1 Aluminium is deposited at the negative electrode.
statement 2 Aluminium ions are less reactive than sodium ions.

The statements may or may not be correct. They may or may not be linked.

Which is correct about the two statements?

- A Both statements are correct and statement 1 explains statement 2.
- B Both statements are correct but statement 2 does not explain statement 1.
- C Statement 1 is correct but statement 2 is incorrect.
- D Both statements are incorrect.

16 When a hot glass rod is placed in a gas jar of hydrogen iodide, the hydrogen iodide decomposes immediately.

Which of the following statements about this reaction are correct?

1 Hydrogen iodide has reacted with oxygen in the air.
2 The hot rod provides the activation energy.
3 One of the products is a dark purple vapour.

- A 1 and 2
- B 1 and 3
- C 2 and 3
- D All of the above
17 Which of the following processes is/are described correctly?

1. Burning of coke requires energy to start the reaction and hence is endothermic.
2. Freezing of water is endothermic as the temperature of the surroundings is cold.
3. Reaction between sodium and water releases heat to the surroundings and hence is exothermic.

A 2 only  
B 1 and 3  
C 2 and 3  
D 1, 2 and 3

18 Yeast is an enzyme which catalyses the fermentation of sugar to ethanol.

Which of the following statements is true for the reaction?

A. The amount of yeast present is unchanged in the reaction.
B. The presence of yeast increases the final amount of ethanol produced.
C. Yeast changes the energy of the reactants and products.
D. Yeast operates effectively at extreme low temperatures.

19 A piece of magnesium strip dissolved completely in 20 cm³ of a dilute sulfuric acid solution and the volume of hydrogen evolved was recorded at regular time intervals. Another piece of magnesium strip of the same surface area and mass was added to 40 cm³ of the same solution of dilute sulfuric acid. How will the initial rate of reaction and the total volume of hydrogen evolved in the second experiment differ from those in the first experiment?

A. Increase  
B. Increase  
C. No change  
D. No change

20 A household bleach contains sodium chlorite (NaClO), as its active ingredient. When sodium chlorite (NaClO) is stirred into excess aqueous hydrogen peroxide, the reaction that occurs is represented by the following equation:

NaClO(aq) + H₂O₂(aq) → NaCl(aq) + O₂(g) + H₂O(l)

Which of the following can be deduced from the reaction?

1. Hydrogen peroxide acts as a reducing agent in this reaction.
2. The final solution gives a precipitate with acidified silver nitrate.
3. The final solution bleaches litmus.

A. 1 only  
B. 3 only  
C. 1 and 2  
D. All of the above

21 Which reagent, when mixed and heated with ammonium sulfite, liberates ammonia?

A. aqueous bromine  
B. acidified potassium manganate(VII)  
C. concentrated sulfuric acid  
D. linewater

22 The equation explains the colour change that occurs when aqueous potassium hydroxide is added to aqueous potassium dichromate(VII) until no further change is seen.

K₂Cr₂O₇ + 2KOH → 2K₂CrO₄ + H₂O

What is substance R?
A. aqueous ammonia  B. ethanoic acid  C. potassium dichromate(VII)  D. steam

25 A mixture of the oxides of two elements of the third period is dissolved in water. The solution is approximately neutral.

What could be the constituents of the mixture?
A. Al₂O₃ and MgO  B. CO₂ and SO₂  C. Na₂O and MgO  D. Na₂O and SO₂

26 Which two processes are involved in the preparation of zinc sulphate crystals from dilute sulphuric acid and zinc oxide?
A. neutralisation and filtration  B. neutralisation and aludation  C. precipitation and filtration  D. precipitation and evaporation

27 Aqueous ethylenimine has similar properties to aqueous ammonia. Which of the following is true about aqueous ethylenimine?
A. It forms a gas with dilute sulphuric acid.
B. It forms white fumes with hydrochloric acid.
C. It forms a colourless solution when added to aqueous aluminium nitrate.
D. It forms blue precipitate with aqueous copper(II) chloride when added in excess.

28 Which information about an element can be used to predict its chemical properties?
A. Colour of its compound  B. Density  C. Melting point  D. Position in the Periodic Table

29 Which of the following substances would produce effervescence when added to aqueous magnesium chloride?
A. Copper  B. Iodine  C. Sodium  D. Zinc

30 An element M is a grey solid at room temperature and pressure. It forms an oxide, NO₂ (melts at 1630°C and boils at 1606°C). It also forms a chloro compound, NCl₅ (melts at -57°C and boils at 114°C).

These suggest that this element M is a ... 1 and its chloro compound is ... 2.

Which words correctly fill in the blanks 1 and 2?

31 Group II nitrates undergo thermal decomposition according to the following equation:

$$2X(NO_3)_2 \rightarrow 2XO + 4NO_2 + O_2$$

Which Group II nitrate requires the highest temperature to bring about its thermal decomposition?
A. Barium nitrate  B. Calcium nitrate  C. Magnesium nitrate  D. Strontium nitrate

32 Dilute sulfuric acid is added to a mixture of excess copper, magnesium and lead in a beaker. The beaker is left for about 10 minutes and its contents are then filtered.

What does the filtrate contain?
A. Copper(II) sulphate, lead(II) sulphate, magnesium sulphate,  B. Copper(II) sulphate, magnesium sulphate,  C. Lead(II) sulphate, magnesium sulphate,  D. Magnesium sulphate
33 In which industrial process is the presence of water not essential?
A electrolytic purification of copper
B manufacture of ethanol from ethene
C manufacture of ethanol by fermentation
D manufacture of iron in the Blast Furnace

34 Powdered carbon and powdered copper are separately heated as shown.

[Diagram showing reaction]

What observations would be seen when each of the substances is heated over a period of time?

Paper 2

Secondary 4 Express

Candidates answer on the Question Paper.
Calculators are allowed in the examination

---

READ THESE INSTRUCTIONS FIRST

Write your class, index number and name on all the work you hand in.
Write in dark blue or black pen.
You may use a soft pencil for any diagrams or graphs.
Do not use staples, paper clips, glue or correction fluid / tape.

Section A
Answer all questions in the spaces provided.

Section B
Answer all three questions, the last question is in the form either/or.
Answer all questions in the spaces provided.

At the end of the examination, fasten all your work securely together.
The number of marks is given in brackets [ ] at the end of each question or part question.

A copy of the Periodic Table is on page 17.

The use of an approved scientific calculator is expected, where appropriate.

<table>

Answer the following questions using only the elements shown in the diagram. Each element may be used once, more than once or not at all.

(a) Which element has 2 electrons only? ____________________________ [1]

(b) Which element has a giant covalent structure? ________________ [1]

(c) Which element(s) form(s) oxides that often result in acid rain? ____________ [1]

(d) Which element has diatomic molecules? ________________________ [1]

(e) Which element gains electrons most readily? _________________ [1]

(f) Which element has one oxidation number only? _________________ [1]

(g) Which element can form a compound of formula MgX? _________________ [1]

[Total: 7]
A2 Nuclear fusion involves two atoms joining to make a heavier atom which releases a lot of energy in the process.

The Sun and other stars use nuclear fusion to release energy. The elements that make up the Sun and the stars are mainly:

- those that undergo nuclear fusion and
- those that are made from nuclear fusion

The sequence of nuclear fusion reactions in a star is complex. Below is one nuclear fusion reaction that could take place in the Sun and the stars.

![Diagram of nuclear fusion reaction]

(a) From the above diagram, what are the two elements mainly present in the Sun and the stars? Explain your answer.

(b) What is the name given for atoms A and B?

(c) Explain why atom C is heavier than atom A.

(Total: 6)
A3 Since 1975, the cars have been installed with catalytic converters to convert harmful pollutants into less harmful emissions before leaving the car exhaust pipe. Most of the cars are powered by burning petrol which is a mixture of hydrocarbons in the car engine. As a result, the pollutants are mainly carbon monoxide, oxides of nitrogen and unburnt hydrocarbons.

(a) Which pollutant is least likely to be produced when the petrol is just ignited in a cold car engine? Explain your answer.

(b) Recent innovation in the automobile industry includes the use of gold to improve the efficiency of oxidation process in catalytic converters.

(i) Why does the use of gold improve the efficiency of the catalytic converter?

(ii) The catalytic converter contains a very small amount of gold. Do you expect the amount of gold to change after the catalytic converter is used for a few years? Explain your answer.

[Total: 4]
A4 John Newlands was one of the first chemists who attempted to classify elements in a systematic way based on atomic weight. In 1866 he suggested that there was a repeating pattern of elements with similar properties every eighth element. Part of Newlands' Periodic Table using his symbols is shown below.

<table>
<thead>
<tr>
<th></th>
<th>H</th>
<th>F</th>
<th>Cl</th>
<th>Co/Ni</th>
</tr>
</thead>
<tbody>
<tr>
<td>Li</td>
<td>Na</td>
<td>K</td>
<td>Cu</td>

<td>Si</td>
<td>Ti</td>
<td>In</td>
<td></td>
</tr>
<tr>
<td>N</td>
<td>P</td>
<td>Mn</td>
<td>As</td>
<td></td>
</tr>
<tr>
<td>O</td>
<td>S</td>
<td>Fe</td>
<td>Se</td>
<td></td>
</tr>
</tbody>
</table>

(a) Describe a trend that is observed in both Newlands's Periodic Table and the Modern Periodic Table that we use today.

[1]

(b) The symbols Gl and Bo have been changed in the Modern Periodic Table. State the current symbols used for Gl and Bo.

Gl

Bo

[2]

(c) Describe one similarity and two differences between the Newland's Periodic Table and the Modern Periodic Table.

[3]

[Total: 6]
A5 Hydrogen has many industrial uses. One possible way to manufacture hydrogen involves the reaction between methane and steam.

\[ \text{CH}_4(g) + \text{H}_2\text{O}(g) \rightarrow \text{CO}(g) + 3\text{H}_2(g) \]

The diagram shows the energy profile diagram for this reaction.

(a) What is one industrial use of hydrogen?

(b) What do the arrows, X and Y, represent in the diagram?

(c) A student wrote the following statement:

In the reaction between methane and steam, the energy for bond forming is smaller than the energy for bond breaking.

Do you agree with the student? Explain your answer.
A6 Hydrogen peroxide is a colourless liquid. An aqueous solution of hydrogen peroxide reacts with the iodide ions in acidified potassium iodide to form water and iodine.

\[ \text{H}_2\text{O}_2(\text{aq}) + 2\text{I}^- (\text{aq}) + 2\text{H}^+ (\text{aq}) \rightarrow 2\text{H}_2\text{O}(l) + \text{I}_2(\text{aq}) \]

(a) (i) Which substance is the reducing agent in this reaction? Explain your answer. 

(ii) Describe the observation when this reaction is complete.

(b) An investigation on the effect of concentration of potassium iodide and dilute sulfuric acid on the speed of reaction occurring between hydrogen peroxide and acidified potassium iodide is carried out. The table shows how the speed of this reaction changes when different concentrations of same volume of potassium iodide and dilute sulfuric acid are used.

<table>
<thead>
<tr>
<th>experiment</th>
<th>concentration of potassium iodide in mol/dm(^3)</th>
<th>concentration of dilute sulfuric acid in mol/dm(^3)</th>
<th>speed of reaction in mol/dm(^3)/s</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>0.1</td>
<td>0.1</td>
<td>0.00017</td>
</tr>
<tr>
<td>2</td>
<td>0.2</td>
<td>0.1</td>

</tr>
<tr>
<td>4</td>
<td>0.3</td>
<td>0.1</td>
<td>0.00051</td>
</tr>
<tr>
<td>5</td>
<td>0.1</td>
<td>0.3</td>
<td>0.00017</td>
</tr>
</tbody>
</table>

(i) Describe the measurement that has to be taken during the investigation in order to calculate the speed of reaction.

(ii) State two key conditions, other than no catalyst is used, that have to be held constant during the investigation.

(iii) Using the information in the table, describe how concentration of the following reagents affects the speed of reaction.

potassium iodide

[1]
sulfuric acid

[1]

A7 Both strontium and sulfur form chlorides of the formula $XCl_2$. The table below compares some of their properties.

<table>
<thead>
<tr>
<th></th>
<th>strontium chloride</th>
<th>sulfur dichloride</th>

<td>• one acidic compound that ionises in water according to the following equation:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>$HA(aq) \rightarrow H^+(aq) + A^-(aq)$</td>
</tr>
</tbody>
</table>

(a) Explain why sulfur dichloride is likely to be a liquid at room temperature.

[1]

(b) Strontium is a metal and sulfur is a non-metal. Explain why both form chlorides of the formula $XCl_2$.

[2]

(c) Deduce the name of the acidic solution formed when sulfur dichloride reacts with water.

[1]

(d) Explain the difference in electrical conductivity of liquid strontium chloride and liquid sulfur dichloride in terms of bonding and structure.

[4]

[Total: 8]
A8 Nylon and protein are macromolecules with amide linkages.

Nylon, a synthetic polymer, has the following structure.

```
\[ \text{Nylon} \]
```

Protein, a natural macromolecule, has the following structure.

```
\[ \text{Protein} \]
```

(a) Describe two differences between nylon and protein.

(b) (i) Draw one repeating unit of nylon.

```
\[ \text{Repeating unit of nylon} \]
```

(ii) Draw two monomers of protein.

```
\[ \text{Monomers of protein} \]
```
Iron is produced in the blast furnace using the ore haematite, iron(III) oxide (melting point 1566°C), as one of the raw materials. Titanium is produced from the ore rutile, titanium dioxide (melting point 1843°C), which cannot be reduced by coke and hence requires a different method of extraction.

Titanium reactors produce about 1 tonne of the metal per day. Iron blast furnaces produce about 20,000 tonnes of the metal per hour.

(a) Explain why the production of low-carbon steel uses oxygen but the production of titanium requires ‘an atmosphere of argon’.

(b) The melting point of iron(III) oxide is higher than the temperature in the blast furnace. Explain why iron(III) oxide could remain in molten state in the blast furnace.
(c) Other than blowing oxygen into molten cast iron, lime (calcium oxide) is also added in the same furnace during the production of low-carbon steel.

Explain the purpose of the addition of lime in the furnace.

[1]

(d) There is less titanium than iron in the Earth's crust.

Other than titanium's scarcity, explain why titanium cost is much more than iron.

[3]

(e) Explain why water is used to wash titanium at the last stage.

[1]

(f) Suggest the position of titanium in the Reactivity Series of Metals. Explain your answer.

[3]

[Total: 12]
B10 A student investigated the electrolysis of sodium chloride solution. The diagram below shows the results of the electrolysis.

(a) Explain why hydrogen gas is produced at the negative electrode.

(b) Explain why gas A cannot be oxygen. Support your answer with relevant equations.

(c) Describe a test to verify the identity of gas A.

[Total: 8]
Alcohols are a homologous series of organic compounds. This homologous series of compounds typically undergoes oxidation.

Using propanol as an example, the reaction scheme of oxidation of alcohol is shown in the box below.

```
CH₃CH₂CH₂OH  →  CH₃CH₂CHO
propanol      propanal
               partially oxidised
               →  final product
```

The propanol is first partially oxidised to an intermediate, propanal, which is then quickly oxidised to the final product.

(a) Such oxidation of alcohol can be achieved by reacting the alcohol using one chemical in the laboratory.

(i) Name the chemical that can be used to oxidise propanol as shown in the above reaction scheme.

(ii) Describe how the chemical in (a)(i) would be used to indicate whether the reaction is complete.

(b) Name the final product in the above reaction scheme.

(c) Butanol undergoes similar oxidation process as propanol.

Name and draw the full structural formula of the Intermediate formed when butanol is partially oxidised.
The table shows the formulae and names of two compounds.

<table>
<thead>
<tr>
<th>Compound</th>
<th>Formula</th>

<td>propanone</td>
</tr>
</tbody>
</table>

A student said:

"I think compound 1 and 2 are from the same homologous series because their relative molecular mass is the same."

Comment on the student's statement.

[3]

[Total: 10]
Cooking oils contain polyunsaturated fats, which are healthier than polysaturated fats.

A scientist wanted to find the amount of polyunsaturated fats in cooking oils.

The scientist tested four cooking oils, V, W, X, Y and Z. The volume of oil and the concentration of bromine water used are the same for each test.

The results are shown below.

<table>
<thead>
<tr>
<th>Cooking oil</th>
<th>Number of drops of bromine water reacted</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>

<td>18</td>
</tr>
<tr>
<td>Y</td>
<td>4</td>
</tr>
<tr>
<td>Z</td>
<td>15</td>
</tr>
</tbody>
</table>

(a) What is meant by the term 'polyunsaturated'?

(b) What type of reaction has occurred between polyunsaturated fats and bromine water?

(c) Describe how bromine water is used to obtain the results in the table.

(d) Which one of the results in the table should be tested again? Explain your answer.
(e) The cooking oil V is claimed to have more polyunsaturated fats than other cooking oils.

Do you agree with the claim? Explain your answer.

[3]

### bII

**1.** Same temperature
**2.** Aqueous hydrogen peroxide (H₂O₂) has to be in excess / some number of moles

**3.** From experiment 1, 2, and 4, as the concentration of potassium iodide increases, the speed of reaction increases.
**4.** From experiment 3, 5, and 6, as the concentration of sulfuric acid increases, the speed of reaction remains constant / the speed of reaction is not affected by concentration of sulfuric acid.

**A7a**
The melting point of sulfur chloride is below / lower than room temperature and boiling point is above / higher than room temperature.

**b**
- Strontium has 2 valence electrons and hence loses two valence electrons to chlorine.
- Sulfur has 6 valence electrons and hence shares two valence electrons with chlorine.

[1] Mark awarded if students only mention strontium loses 2 electrons and sulfur shares gains 2 electrons.

**c**
Hydrochloric acid

**d**
- Liquid/monomolecular strontium chloride is an ionic compound which has a giant ionic crystal lattice that has been broken down / electrostatic attraction is overcome and hence there are 2 ions.
- Liquid sulfur chloride has a simple molecular structure [1] consists of only molecules [1]

**A8a**
1. Nylon has only two monomers but protein has 3 monomers / at least 3 monomers / many monomers.
2. In nylon, one monomer has two COOH and the other monomer has two NH₂ but in protein, each monomer has one COOH and one NH₂.

**OR**
- In nylon, one monomer is a dicarboxylic acid and the other is a diamine but in protein, all monomers are amino acids.

### bi

**Protein monomers**

- Any two of the following

- [Diagram of protein structure]

**bIIa**
- Oxygen is needed to react with oxidised carbon to reduce carbon content and produce low-carbon steel.
- In the presence of impurities such as silicon dioxide and hence iron(III) oxide could melt at lower temperatures.
- Acceptor impurities such as silicon and phosphorus or the energy released from the combustion of carbon dioxide results in more heat / higher temperature in the blast furnace for iron(III) oxide to melt.

**c**
- To react with acidic impurities such as silicon dioxide and remove them as molten slag.

**d**
- There are more stages to manufacture titanium less efficient / more energy are needed.
- In one day, blast furnace could produce (24 x 20000) = 480,000 tonnes of metal which the blast furnace could only produce 1 tonne of metal and hence the rate of production is slower.
- Blast furnace uses coke/carbon which is abundant and cheaper than magnesium / magnesium used in reactor is more expensive than potash/carbon because it is extracted by electrolysis.

**e**
To remove soluble magnesium chloride from titanium.

**f**
- Titanium is below magnesium AND above zinc in the reactivity series.

- Magnesium could displace titanium from titanium(IV).
**B10** Both hydrogen ions / H\(^+\) AND sodium ions / Na\(^+\) in sodium nitrate solution are attracted / migrate to the negative electrode / are in the solution. Hydrogen ions / H\(^+\) are more preferentially discharged / reduced than sodium ions / Na\(^+\) and hence hydrogen gas is produced at the negative electrode.

**b** At anode / positive electrode: 2O\(_2\)\(\text{aq}\) → 4O\(_2\)\(\text{g}\) + 4e\(^-\)

The volume gas A is the same as the volume of hydrogen. The concentration of chloride ions / Cl\(^-\) is higher than hydroxide ions / OH\(^-\). Therefore chloride ions / Cl\(^-\) are discharged / oxidised instead of hydroxide ions / OH\(^-\) at the anode.

**c** Gas A would turn moist blue litmus red and then bleach if bleached moist red litmus paper. And hence it is chlorine.

**E8 homework B11 a** Acidified aqueous potassium dichromate(VI) / potassium manganate(VII)

**all** Add acidified aqueous potassium dichromate(VI) / potassium manganate(VII) dropwise / drop by drop to propanal.

If potassium dichromate(VI) turn from orange to green / potassium manganate(VII) turn from purple to colourless with every drop, reaction is not complete.

If potassium dichromate(VI) remains orange / potassium manganate(VII) remains purple / not decolourised, reaction is complete.

**d** Compound 1 and 2 are isomers.

They have the same molecular formula / same type and number of each atom and hence relative molecular mass is the same.

However, their functional groups are not the same and hence they do not come from the same homologous series.

**OR**

**B14 a** A polymer / macromolecule with many C=C / carbon-carbon double (covalent) bonds

**b** Addition

**Reject: Addition polymerisation**

**c** Add bromine (water) dropwise / drop by drop to the fats. Count the number of drops.

Until bromine (water) remains reddish brown.

**d** Test 2 for oil W both need to be correct [Always W, 19]

Result is not consistent with test 1 and 3 / is anomalous

[Reject: does not fit pattern/trend]

**e** No [No marks]

The greater the number of drops of bromine (water) used, the more polyunsaturated / unsaturated fats in the cooking oil.

W and X have more polyunsaturated / unsaturated fats than Y

(Accept: W has the most unsaturated fats)

[Ignore Z, has more unsaturated fats]

V has much more polyunsaturated / unsaturated fats than Y only.
1. Oxygen was prepared from hydrogen peroxide and collected as shown in the diagram.
   \[ 2\text{H}_2\text{O}_2 \rightarrow \text{2H}_2\text{O} + \text{O}_2 \]

2. Which of the following is the best method of obtaining pure water from ink?
   A. Chromatography
   B. Distillation
   C. Filtration
   D. Freezing
3 The diagrams show mixtures of chemicals that react to produce gases. In which reaction will the litmus paper change colour?

A. damp blue litmus paper
B. damp red litmus paper

C. dilute hydrochloric acid
D. sodium carbonate

C. damp blue litmus paper
D. damp red litmus paper

aqueous sodium hydroxide
ammonium chloride

4 Which statement about the numbers of particles in atoms is correct? Apart from hydrogen, most atoms contain

A. more electrons than protons.
B. more neutrons than protons.
C. more protons than electrons.
D. more protons than neutrons.

5 In one molecule of carbon dioxide, CO₂, what is the total number of electrons present and how many are involved in bonding between the carbon and oxygen atoms?

<table>
<thead>
<tr>
<th>total number of electrons</th>
<th>electrons involved in bonding</th>
</tr>
</thead>
<tbody>
<tr>
<td>A 16</td>

6 The symbols and electronic structures for some elements are shown below. silicon, Si (2,8,4) oxygen, O (2,6) hydrogen, H (1) fluorine, F (2,7) nitrogen, N (2,5)

Which formula is correct for a compound containing silicon?

A. SiF₄  B. SiH₄  C. SiN₅  D. Si₂O

7 The formula of an oxide of uranium is UO₂. What is the formula of the corresponding chloride?

A. UCl₂  B. UCl₅  C. U₂Cl₄  D. U₄Cl₉

8 Elements X and Y combine to form the gas XY₂. What are X and Y?

<table>
<thead>

</table>

9 An 8 g sample of oxygen atoms contains the same number of atoms as 16 g of element X. What is the relative atomic mass, A_r, of X?

A. 4  B. 8  C. 16  D. 32
10. Which of the samples below has the greatest mass?
   A. $6 \times 10^{25}$ molecules of hydrogen
   B. 50 mol of neon atoms
   C. $1.2 \times 10^{24}$ atoms of silver
   D. $1.7 \times 10^3$ g of iron

11. An electrical circuit is set up using copper wire.

```
   +----------------+
   |                |
   | copper wire    |
   |                |
   +----------------+
   |                |
   | lamp           |
```

Which process takes place in the copper wire?
   A. Electrons move along the wire to the negative terminal, positive ions stay in position
   B. Electrons move along the wire to the positive terminal, positive ions move to the negative terminal
   C. Electrons move along the wire to the positive terminal, positive ions stay in position
   D. Negative ions move along the wire to the positive terminal, positive ions move to the negative terminal.

12. A substance Q conducts electricity both when solid and molten. What is Q?
   A. an alloy
   B. a hydrocarbon
   C. a metal oxide
   D. a salt

13. The diagram shows the electrolysis of concentrated aqueous sodium chloride.

```
   anode
   - carbon
   - rod
   cathode
   concentrated
   aqueous sodium
   chloride and litmus
```

What is the colour of the litmus at each electrode after five minutes?

<table>
<thead>

14. In which of the following reaction is sulfur dioxide acting as an oxidizing agent?
   A. $SO_2 + 2H_2O + Cl_2 \rightarrow H_2SO_4 + 2HCl$
   B. $SO_2 + 2NaOH \rightarrow Na_2SO_3 + H_2O$
   C. $2SO_2 + O_2 \rightarrow 2SO_3$
   D. $SO_2 + 2H_2S \rightarrow 2H_2O + 3S$

15. Substance X liberates iodine from aqueous potassium iodide and decolourises acidified aqueous potassium manganate(VII).
   How is the behaviour of X described?
   A. as an oxidising agent only
   B. as a reducing agent only
   C. as an oxidising agent and a reducing agent
   D. as neither an oxidising agent nor a reducing agent
16 Which graph shows the effect of increasing temperature on the rate of reaction of calcium carbonate with dilute hydrochloric acid?

A

B

C

D

17 Sulfuric acid (H₂SO₄) and nitric acid (HNO₃) are both strong acids. Ethanoic acid (CH₃COOH) is a weak acid.

20.00 cm³ solutions of 0.10 M concentration of each of these three acids were separately titrated with a 0.10 M solution of sodium hydroxide (NaOH) in order to react completely.

A all three acids would require the same volume of NaOH
B CH₃COOH and HNO₃ would require the same volume of NaOH but H₂SO₄ would require more.
C HNO₃ would require more NaOH than CH₃COOH but less than H₂SO₄.
D H₂SO₄ and HNO₃ would require the same volume of NaOH but CH₃COOH would require less.

18 A 25 cm³ sample of dilute sulfuric acid contains 0.025 moles of the acid. What is the concentration of hydrogen ions in the solution?

A 2.00 mol / dm³
B 1.00 mol / dm³
C 0.50 mol / dm³
D 0.25 mol / dm³

19 Titration of an acid against a base is a method often used in the preparation of salts. Which properties of the acid, the base, and the salt are required if this method is to be used?

#### Key
- $X$ = atomic symbol
- $^{a}$ = relative atomic mass
- $^{b}$ = proton (nuclear) number

1. The volume of one mole of any gas is 24 dm$^3$ at room temperature and pressure (r.t.p.)
READ THESE INSTRUCTIONS FIRST

Write your class, index number and name on all the work you hand in.
Write in dark blue or black pen on both sides of the paper.
You may use an HB pencil for any diagrams or graphs.
Do not use staples, paper clips, glue or correction fluid.

This is Section A of the paper

Section A
Answer all questions in the spaces provided.

The number of marks is given in brackets [ ] at the end of question or part question.
A copy of the Periodic Table is printed on page 13 of Section B.
The use of an approved scientific calculator is expected, where appropriate.

At the end of the examination, hand in the following separately:
(1) Section A
(2) Section B

FOR EXAMINER'S USE

<table>

This document consists of 15 printed pages.
REPRODUCTION OF ANY PART OF THIS QUESTION PAPER WITHOUT PERMISSION IS STRICTLY PROHIBITED.
Section A

Answer all the questions in this section in the spaces provided. The total mark for this section is 50.

The diagram shows the structures of five compounds, A, B, C, D and E, containing carbon.

Answer these questions using the letters A, B, C, D or E. Each compound can be used once, more than once or not at all.

Which one of these compounds

(a) can change the colour of aqueous bromine ________ [1]

(b) is a product of respiration ________ [1]

(c) is the main constituent of natural gas ________ [1]

(d) is a product of substitution reaction ________ [1]

(e) is a liquid at room temperature and pressure ________ [1]

[Total : 5]
A2  (a) The Kinetic Theory explains the properties of solids, liquids and gases in terms of the movement of particles. Liquids and gases both take up the shape of the container but a gas always fills the container. Explain this, using the ideas of the Kinetic Theory.

(b) The following apparatus can be used to measure the rate of diffusion of a gas.

(i) What measurements would need to be taken to calculate the rate of diffusion of a gas?
A2 (ii) Which gas, carbon dioxide or sulfur dioxide, would diffuse faster? Explain your choice.

For Examiner's Use

(c) A 20 cm$^3$ sample of butyne, C$_4$H$_6$, is burnt in 150 cm$^3$ of oxygen.

\[2C_4H_6(g) + 11O_2(g) \rightarrow 8CO_2(g) + 6H_2O(l)\]

What is the total volume of gases left at the end of the reaction?

[Total: 10]
A3 Insoluble salts are made by precipitation.

(a) A preparation of the insoluble salt calcium fluoride is described below.
To 15 cm³ of aqueous calcium chloride, 30 cm³ of aqueous sodium fluoride is added.
The concentration of both solutions is 1.00 mol/dm³. The mixture is filtered
and the precipitate washed with distilled water. Finally, the precipitate is
heated in an oven.

(i) Write the ionic equation (including state symbols) for the reaction.

(ii) Why is the volume of sodium fluoride solution double that of the
calcium chloride solution?

(iii) Why is the precipitate washed with distilled water?

(iv) Why is the solid heated?

[2]

[1]
A3 (b) The formulae of insoluble compounds can be found by precipitation reactions. 2.0 cm$^3$ of aqueous sodium phosphate, Na$_3$PO$_4$ was added to 12.0 cm$^3$ of an aqueous solution of the nitrate of metal M. The concentration of both solutions was 1.00 mol/dm$^3$. When the precipitate had settled, its height was measured.

The experiment was repeated using different volumes of the phosphate solution. The results are shown on the following graph.

What is the formula of the phosphate of metal M? Explain your reasoning.

[Total: 8]
A4  Ethylamine, CH₃–CH₂–NH₂, is a base which has similar properties to ammonia.

(a) In aqueous ethylamine, there is the following reaction:

\[ \text{CH}_3\text{–CH}_2\text{–NH}_2 + \text{H}_2\text{O} \rightleftharpoons \text{CH}_3\text{–CH}_2\text{–NH}_3^+ + \text{OH}^- \]

Given aqueous solutions of ethylamine and sodium hydroxide, describe how you could show that ethylamine is a weak base like ammonia and not a strong base like sodium hydroxide.

(b) Ethylamine, like ammonia, reacts with acids to form salts.

\[ \text{CH}_3\text{–CH}_2\text{–NH}_2 + \text{HCl} \rightarrow \text{CH}_3\text{–CH}_2\text{–NH}_3\text{Cl} \]

ethylammonium chloride

Suggest how you could displace ethylamine from the salt, ethylammonium chloride.

(c) Explain the chemistry of the following reaction:
When aqueous ethylamine is added to aqueous iron(III) chloride, a red-brown precipitate is formed.

[Total: 6]
A5 The reactivity series shows the metals in order of reactivity.

(a) The reactivity series can be established using displacement reactions. A piece of zinc is added to aqueous lead(II) nitrate. The zinc becomes coated with a black deposit of lead.

\[ \text{Zn} + \text{Pb}^{2+} \rightarrow \text{Zn}^{2+} + \text{Pb} \]

Zinc is more reactive than lead. The reactivity series can be written as a list of ionic equations.

\[ \text{Zn} \rightarrow \text{Zn}^{2+} + 2\text{e}^- \]
\[ \text{Fe} \rightarrow \text{Fe}^{2+} + 2\text{e}^- \]
\[ \text{Pb} \rightarrow \text{Pb}^{2+} + 2\text{e}^- \]
\[ \text{Cu} \rightarrow \text{Cu}^{2+} + 2\text{e}^- \]
\[ \text{Ag} \rightarrow \text{Ag}^+ + \text{e}^- \]

(i) Explain why the positive ions are likely to be oxidants (oxidising agents). [1]

(ii) Deduce which ion in the list above is the best oxidant (oxidising agent): [1]

(iii) Which ion(s) in the list can oxidise lead metal? [1]
A5  (b) A reactivity series can also be established by measuring the voltage of simple cells. The diagram shows a simple cell.

![Diagram of a simple cell with a voltmeter, cadmium electrode, copper electrode, and sulfuric acid.]

Results from cells using the metals tin, cadmium, zinc and copper are given in the table below.

<table>
<thead>
<tr>
<th>Cell</th>
<th>Electrode 1 (Positive electrode)</th>
<th>Electrode 2 (Negative electrode)</th>
<th>Voltage / Volts</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>

[Total : 6]
A6 An electrolytic process known as electro-refining is the final stage in producing highly purified copper. In a small-scale trial, a lump of impure copper is used as one electrode and a small plate of pure copper is used as the other electrode. The electrolyte is a mixture of aqueous sulfuric acid and copper(II) sulfate.

(a) Indicate in the box labelled 'polarity' on the diagram above, the polarity of the impure copper electrode by putting either + or -.

In a trial experiment, the electrodes were weighed before and after electrolysis. The results are provided in the following table.

<table>
<thead>
<tr>
<th></th>
<th>Mass of lump of impure copper</th>
<th>Mass of pure copper</th>
</tr>
</thead>
<tbody>
<tr>
<td>Before electrolysis</td>
<td>10.30 kg</td>
<td>1.55 kg</td>
</tr>
<tr>
<td>After electrolysis</td>
<td>0.855 kg</td>
<td>9.80 kg</td>
</tr>
</tbody>
</table>

(b) On the basis of these results

(i) calculate the percentage purity of the lump of impure copper;
(ii) state one factor that may affect the accuracy of these results.

(c) Lumps of impure copper typically contain impurities such as silver, gold, cobalt, nickel and zinc. Cobalt, nickel and zinc are oxidised from the copper lump and exist as ions in the electrolyte. Silver and gold are not oxidised and form part of an insoluble sludge at the base of the cell. Why is it important that silver and gold are not present as cations in the electrolyte?
A7 There are two types of polymerisation - addition and condensation.

(a) Describe the difference between them.

(b) Poly(dichloroethene) is used to package food. The structural formula of dichloroethene is shown below.

\[
\begin{array}{c}
\text{H} \\
\text{C} \quad \text{Cl} \\
\text{H} \\
\text{C} \quad \text{Cl}
\end{array}
\]

Draw the structure of poly(dichloroethene) showing two repeat units. [2]
A7 (c) The polymer known as PVA is used in paints and adhesives. Its structure is shown below.

\[
\begin{array}{c}
\text{CH}_2 \quad \text{CH} \quad \text{CH} \quad \text{CH} \\
\text{OOCCH}_3 \quad \text{OOCCH}_3
\end{array}
\]

Deduce the structural formula of its monomer. [1]

(d) A condensation polymer can be made from the following monomers.

\[
\text{HOOC(CH}_2\text{)}_4\text{COOH} \quad \text{and} \quad \text{H}_2\text{N(CH}_2\text{)}_6\text{NH}_2
\]

(i) Draw the structure of this polymer showing two repeat units. [2]

(ii) Describe the pollution problems caused by non-biodegradable polymers.

INSTRUCTIONS TO CANDIDATES

Write your class, index number and name on all the work you hand in.
Write in dark blue or black pen on both sides of the paper.
You may use an HB pencil for any diagrams or graphs.
Do not use staples, paper clips, glue or correction fluid.

This is Section B of the paper

Section B
Answer all three questions, the last question is in the form either/or.
Answer all questions in the spaces provided.

The number of marks is given in brackets [ ] at the end of question or part question.
A copy of the Periodic Table is printed on page 13.
The use of an approved scientific calculator is expected, where appropriate.
B8  (a) Enzymes are biological catalysts. They are used both in research laboratories and in industry. Enzymes called proteases can hydrolyse proteins to amino acids. The amino acids can be separated and identified by chromatography. A drop that contains a mixture of four amino acids was applied to a thin layer chromatography plate. The plate was placed in solvent G and the following chromatogram was obtained.

![Chromatogram]

The R<sub>f</sub> values for each of the amino acids in solvent G are provided in the table below.

<table>
<thead>

B8  (i) Name the amino acid that corresponds to spot 1.

(ii) What factor determines the different R_f values of the different amino acids?

(iii) Explain why the chromatogram must be exposed to a locating agent before R_f values can be measured.

(iv) Measuring R_f values on a chromatogram is one way of identifying amino acids. Suggest another.

(v) The plate was dried, rotated through 90° in an anticlockwise direction and then placed in solvent F. The R_f values for each of the amino acids in solvent F are provided in table below.

The following chromatogram was obtained.
B8 Circle the spot on chromatogram II that represents alanine. [1]

Explain, in terms of the data provided, why only three spots are present in chromatogram I while four spots are present in chromatogram II. [2]

(b) The enzyme called zymase catalyses the anaerobic respiration of glucose during fermentation which can be carried out in the apparatus drawn below. After a few days the reaction stops. It has produced a 12% aqueous solution of ethanol.

(i) Complete the equation.

\[ \text{C}_6\text{H}_{12}\text{O}_6 \rightarrow \text{___________} + \text{___________} \] [1]

(ii) Suggest a reason why the reaction stops after a few days.

\[ \text{___________} \] [1]

(iii) Why is it essential that there is no oxygen in the flask?

\[ \text{___________} \] [1]

[Total: 10]
B9 (a) The rate of the reaction between iron and aqueous bromine can be investigated using the apparatus shown below.

A piece of iron was weighed and placed in the apparatus. It was removed at regular intervals and the clock was paused. The piece of iron was washed, dried, weighed and replaced. The clock was restarted. This was continued until the solution was colourless. The mass of iron was plotted against time. The graph shows the results obtained.

(i) Suggest an explanation for the shape of the graph.

B10 (a) A 'QwikCure' pack, used to treat sporting injuries, contains a bag of water inside a larger bag of finely powdered ammonium nitrate, \( \text{NH}_4\text{NO}_3 \). Squeezing the pack causes the bag of water to break and the \( \text{NH}_4\text{NO}_3 \) to dissolve.

The change of energy that occurs can be used to treat an injury.

\[
\text{NH}_4\text{NO}_3 (s) \rightarrow \text{NH}_4\text{NO}_3 (aq) \quad \Delta H = +25 \text{ kJ/mol}
\]

(i) State and explain if the dissolving process is exothermic or endothermic.

B10 (b) Sodium reacts with nitrogen to form a compound called sodium nitride.

The chemical formula of sodium nitride is $\text{Na}_3\text{N}$.

A sample of sodium in a porcelain boat was heated in a combustion tube while nitrogen gas was passed over it.

The following masses were recorded.

- Mass of porcelain boat when empty = 14.84 g
- Mass of porcelain boat + sodium = 15.13 g
- Mass of porcelain boat + sodium nitride = 15.19 g

(i) Determine the empirical formula of sodium nitride. [3]

(ii) Write an equation for the formation of sodium nitride. [1]

[Total: 10]
B10 (a) In 1894, the scientist W. Ramsay, carried out the following experiments starting with 100 cm$^3$ of air.

The 100 cm$^3$ of air were passed through solution X to remove traces of acidic gases. Then the air was bubbled through concentrated sulfuric acid to remove water vapour. The remaining gases were treated with excess of hot copper and the volume decreased from almost 100 cm$^3$ to 80 cm$^3$. The gases that did not react with hot copper were heated with magnesium. 1 cm$^3$ of gas Y remained and a white solid Z was formed. Solid Z reacted with water to form only magnesium hydroxide and ammonia.

(i) Name the ion, in solution X, which reacts with the acidic gases. [1]

(ii) Give the formula of solid Z. [1]

(iii) Gas Y has a density of 1.66 g/dm$^3$ at r.t.p. Calculate the mass of 1 mole of gas Y and hence identify the gas. [1]

(iv) Most gases are identified by a chemical test.
Why must gas Y be identified using a physical property? [1]
B10 (b) The table shows some properties of gases in dry air.

In 1895, Lord Rayleigh isolated nitrogen from dry air by removing the other known gases, oxygen and carbon dioxide. He then discovered that nitrogen from dry air had a different density to pure nitrogen produced from chemical reactions. He concluded that nitrogen extracted from dry air was mixed with another gas. The density of nitrogen extracted from dry air was higher than the density of pure nitrogen.

Use the information above to explain why.
B10 (c) Minimising air pollution is essential for health and for the environment.

(i) Low sulfur fuels are being introduced. Ordinary diesel contains 500 ppm of sulfur but low sulfur diesel contains less than 50 ppm. Why is this an advantage to the environment?

(ii) Catalytic converters reduce pollution from motor vehicles, as shown in the following diagram.

```
  oxides of nitrogen
  carbon monoxide
  unburnt hydrocarbons
  less harmful gases
to atmosphere

  catalysts: rhodium, platinum, palladium
```

Rhodium catalyses the decomposition of the oxides of nitrogen.

\[ 2\text{NO} \rightarrow \text{N}_2 + \text{O}_2 \]

Two other pollutants are carbon monoxide and unburnt hydrocarbons.

How are they converted into less harmful substances?

*58-80 Lanthanoid series
*155-186 Actinoid series

Key

- **X** = atomic symbol
- **a** = relative atomic mass
- **b** = proton (or atom) member

The volume of one mole of any gas is 24 dm³ at room temperature and pressure (r.t.p.)
**MSHS 2015 Chemistry Prelim II Answer Key**

### Paper 1

**Q no.** | **Answer**
---|---
1 | C, A, D, B, D, A, E
2(a) | In liquid, the particles are close together; the strong forces of attraction between the particles do not allow them to move apart. They can move in the volume of the liquid to take up the shape of the container. In gas, the forces are much weaker and the particles can move in all directions freely to fill the container.
2(b) | Measure the volume of gas left in the gas syringes (or volume of gas that escapes) at regular intervals of time.
2(c) | Carbon dioxide has lower relative molecular mass / molar mass / mass.
3(a)(i) | From the equation,
2 moles of CaCl₂ react with 11 moles of O₂
Since both are gases at rt, applying Avogadro's Law,
2 volumes of CaCl₂ react with 11 volumes of O₂ to form 8 volumes of CO₂
Thus 30 cm³ of CaCl₂ react with 110 cm³ of O₂ to form 80 cm³ of CO₂
Volume of gas left = 40 cm³ of excess O₂ + 80 cm³ of carbon dioxide = 120 cm³
3(b)(i) | Ca²⁺ (aq) + 2F⁻ (aq) → CaF₂(s)
3(b)(ii) | Mole ratio of F⁻ (for NaF) : Ca²⁺ (for CaCl₂) is 2 : 1
3(b)(iii) | To remove sodium chloride or sodium fluoride or calcium chloride solution
3(b)(iv) | To dry (precipitate) or to remove water or to evaporate water
4(a) | Using equal volume and concentration of both solutions, add a few drops of Universal indicator pH sensor / pH meter; indicator in ethylamine shows blue/indigo while that in sodium hydroxide shows violet / ethylamine has a lower pH or
Using equal volume and concentration of both solutions.

### Paper 2 Section A

**Q no.** | **Answer**
---|---
5(a)(i) | They can accept or gain electrons from another substance to form atoms.
5(a)(ii) | Silver ion (Ag⁺) and copper(II) ion (Cu²⁺)
5(b)(i) | Copper, tin, cadmium, zinc, copper is the least reactive metal as it is always the positive electrode, zinc is the most reactive since the voltage is the highest, followed by cadmium, then tin or the bigger the difference in reactivity between the metals, the bigger the voltage
5(b)(ii) | Silver and gold ions (when present in higher concentration than copper(II) ions) could be selectively charged to form silver and gold which is deposited at the pure copper plate.
7(a) | Any TWO
Addition polymerisation produces only one product, the polymer, but condensation polymerisation produces the polymer and a by-product such as water.
In addition polymerisation, each monomer has a carbon-carbon double bond while in condensation polymerisation, each monomer has a functional group at each end.
Paper 2 Section B

Q no Answer

8(a) tyrosine

(i) Difference in solubility of the amino acids in the solvent used

(ii) The spots are colourless, indicating that the spots form coloured substances

(iv) Determination of melting point and/or boiling point

(b)(i) 

\[
\text{CaH}_2\text{O}_4 \rightarrow 2\text{C}_2\text{H}_4\text{O}_2 + 2\text{CO}_2
\]

(b)(ii) Yeast is "killed"/poisoned by ethanol

(iii) Oxygen will oxidise ethanol to ethanoic acid or oxygen is absent to ensure anaerobic respiration of glucose occurs so as to form ethanol.

9(a)(i) Rate at which mass of iron decreases higher/gradient decreases because concentration of aqueous bromine decreases; mass of iron stops decreasing/gradient becomes zero because all the aqueous bromine is used up

(ii) The initial rate/gradient is greater because of bigger surface area from more iron particles exposed; final mass of iron is the same because the same mass of iron is reacted with aqueous bromine

(iii) Repeat the experiment using same mass of iron and same volume and concentration of aqueous bromine but by increasing/decreasing the speed of stirring while heating the iron piece; measure the mass of iron piece at regular time intervals; calculate the rate of reaction/gradient and compare

(b) Coke is heated in air to form carbon dioxide; \( \text{C} + \text{O}_2 \rightarrow \text{CO}_2 \)

Carbon dioxide reacts with more coke to form carbon monoxide; \( \text{CO}_2 + \text{C} \rightarrow 2\text{CO} \)

Carbon monoxide reduces [iron(III) oxide] to iron, and forms: \( \text{Fe}_2\text{O}_3 + 3\text{CO} \rightarrow 2\text{Fe} + 3\text{CO}_2 \)

10 OR

(a)(i) Hydroxide (ion)

(ii) \( \text{Mg}_2\text{N}_2 \)

(iii) Molar mass \( = 1.66 \times 24 = 39.84 \text{ g} \) or \( 39 \text{ g} \) to 3 sig. fig

Gas Y is argon/ \( \text{Ar} \)

(iv) Argon is a noble gas; has completely filled valence shells and is chemically unreactive or inert

(b) Nitrogen from dry air contains argon/krypton/xenon; argon/krypton/xenon have density higher than that of nitrogen

(c)(i) Combustion of low sulfur diesel would release less sulfur dioxide into the atmosphere, less acid rain would be formed which means less corrosion to limestone buildings and/or metal structures

(i) Carbon monoxide would be converted into carbon dioxide; unburnt hydrocarbons (reacted with oxygen) are converted to carbon dioxide and water (vapour)
1. Two experimental set-ups used to demonstrate diffusion of gases are shown in the diagram below. The gas in each porous tube is nitrogen (M_e is 28).

   In experiment 1, the gas introduced into the beaker is carbon monoxide (M_e is 28) while in experiment 2, the gas is argon (M_e is 40).

   Experiment 1
   carbon monoxide gas
   porous tube containing nitrogen gas
   beaker

   Experiment 2
   argon gas
   porous tube containing nitrogen gas
   beaker

   What changes, if any, to the water levels at P and Q would you expect to see in both experiments?

3. Which quantity is the same for 1 mole of ethane and 1 mole of ethene?

   A. mass
   B. number of molecules
   C. number of atoms
   D. number of ions

4. Toluene and cyclohexane are two common organic solvents and they form a homogeneous mixture when mixed together.

   The following graph shows the boiling points of mixtures containing different percentages of toluene and cyclohexane.

   ![Graph showing boiling points of toluene and cyclohexane mixtures]

   Which of the following best describes the boiling point of any mixture of toluene and cyclohexane as shown by the graph?

   A. The boiling point is below that of toluene.
   B. The boiling point is higher than that of cyclohexane.
   C. The boiling point is below that of both toluene and cyclohexane.
   D. The boiling point is between that of toluene and cyclohexane.
5 A beam of particles contains neutrons, n, protons, p, and electrons, e. The beam is passed between charged plates.

Which diagram shows how the particles are affected by the plates?

A  
```
 neutron (n)  
 proton (p)  
 negative electron (e) 
```

B  
```
 neutron (n)  
 proton (p)  
 positive electron (e) 
```

C  
```
 neutron (n)  
 proton (p)  
 negative electron (e)

D  
```
 neutron (n)  
 proton (p)  
 positive electron (e) 
```

6 Graphene, an allotrope of carbon has a similar structure to graphite, except that, it has one hydrogen atom attached to each carbon as shown in the diagram.

Which set of properties will graphene have?

1. It is hard.
2. It has a giant molecular structure.
3. It conducts electricity in the solid state.

A - 1 and 2
B - 1 and 3
C - 2 and 3
D - 1, 2 and 3

7 The formulae of the ions of some elements are shown below:

```
P^+  O^2-  Cl^-  Na^+  Ca^2+
```

Which of the following statements about these ions is correct?

A - All have full outer shell
B - All have the same number of electron shells
C - All have the same number of neutrons in their nuclei
D - All have more electrons than protons

8 Four substances have the following electrical properties:

<table>
<thead>
<tr>
<th>Substance</th>
<th>Property</th>

11 Which reaction takes place in the blast furnace?

- A 3Fe + 4H₂O → Fe₃O₄ + 4H₂
- B SiO₂ + CaO → CaSiO₃
- C SiO₂ + 2NaOH → Na₂SiO₃ + H₂O
- D Fe₂O₃ + 4C → Fe₃O₄ + 2C + 4CO

12 Dinotrogen tetroxide, N₂O₄, is a poisonous gas. It can be disposed of safely by reaction with sodium hydroxide in the experiment, the concentration of aqueous sodium hydroxide used is 1.5 mol/dm³.

\[ N₂O₄ (aq) + 2NaOH (aq) → Na₂NO₃ (aq) + NaNO₂ (aq) + H₂O (l) \]

Which of the following is the least volume of aqueous sodium hydroxide required to dispose of 350 cm³ of H₂O₂ at room temperature and pressure?

- A 10 cm³
- B 20 cm³
- C 120 cm³
- D 240 cm³

13 The dissociation constant for an acid indicates the extent to which it dissociates into ions. The higher the dissociation constant, the stronger the acid.

The dissociation constant for some acids are given below along with two possibly correct statements:

<table>
<thead>
<tr>
<th>Acid</th>
<th>Dissociation Constant</th>
</tr>
</thead>
<tbody>
<tr>
<td>Methanoic acid, HCOOH</td>
<td>1.80 x 10⁻⁴</td>
</tr>
<tr>
<td>Ethanoic acid, CH₃COOH</td>
<td>1.76 x 10⁻⁵</td>
</tr>
<tr>
<td>Propanoic acid, CH₃CH₂COOH</td>
<td>1.34 x 10⁻⁴</td>
</tr>
<tr>
<td>Chloroethanoic acid, CH₂ClCOOH</td>
<td>1.40 x 10⁻⁵</td>
</tr>
</tbody>
</table>

Statement 1: Increasing the length of the carbon chain makes the acid stronger.
Statement 2: Replacing a hydrogen by a chlorine in ethanoic acid makes the acid stronger.

Based on the data above, which of the above two statements are correct?

- A Statement 1 and 2
- B Statement 1 only
- C Statement 2 only
- D Neither statement

14 Which pair of reagents is most suitable in preparing the following salts?

<table>
<thead>
<tr>
<th>Salt</th>

<td>Add aqueous sodium hydroxide, A white precipitate was formed</td>
</tr>
<tr>
<td>D</td>
<td>Add aqueous sodium hydroxide and aluminium foil, then heat, A gas was evolved that turned moist red litmus paper blue</td>
</tr>
</tbody>
</table>
16. During an experiment, 10 cm$^3$ of 1.0 mol/dm$^3$ sodium hydroxide, NaOH, is gradually added to 10 cm$^3$ of 2.0 mol/dm$^3$ sulfuric acid, H$_2$SO$_4$, containing methyl orange indicator.

Which change occurs in the mixture?

A. The concentration of the OH$^-$ ions increases
B. The methyl orange changes colour
C. A precipitate is formed
D. More water molecules are formed

17. To reduce atmospheric pollution, the waste gases from a coal-burning power station are passed through a wet suspension of powdered calcium carbonate.

Which waste gas will NOT be removed by powdered calcium carbonate?

A. carbon monoxide, CO
B. nitrogen dioxide, NO$_2$
C. sulfur dioxide, SO$_2$
D. phosphorus(V) oxide, P$_2$O$_5$

18. An aqueous solution of a salt, X, is placed in a test-tube and sodium hydroxide solution is gradually added. The height of the precipitate in the test-tube is plotted against the volume of sodium hydroxide added.

Which cation is found in X?

A. aluminium ion
B. ammonium ion
C. copper(II) ion
D. iron(II) ion

19. Equations for reactions of iron and iron compounds are shown:

1. Fe + 2HCl → FeCl$_2$ + H$_2$
2. 2FeCl$_3$ + Cu → 2FeCl$_2$ + CuCl$_2$
3. FeSO$_4$ + Mg → Fe + MgSO$_4$
4. FeSO$_4$ + 2NaOH → Fe(OH)$_2$ + Na$_2$SO$_4$ + H$_2$

How many of these are redox reactions?

A. 1
B. 2
C. 3
D. 4

20. Waste gases from a car engine are passed through a catalytic converter to remove the pollutant gases. One of pollutant gases is nitrogen monoxide. The equation below shows how it is removed:

2CO + 2NO → N$_2$ + 2CO$_2$

Which statement about the reaction is incorrect?

A. The oxidation state of carbon changes from +2 to +4
B. The oxidation state of nitrogen changes from +2 to 0
C. The oxidation state of oxygen is unchanged
D. The oxidation state of oxygen changes from -2 to -4

21. The table shows the reactions of each of the metals A, B, C and D with separate solutions containing ions of the other metals.

22 The following gases can be found in the blast furnace that used to extract iron

1 Carbon monoxide
2 Carbon dioxide
3 Nitrogen

Which of the above gases can be both a reactant and a waste gas?

A 1 only
B 1 and 2 only
C 1 and 3 only
D 1, 2 and 3

23 The positions of four elements are shown in the outline of part of the Periodic Table.

Element X has a high melting point and is a good conductor of electricity. It forms chlorides XCl₂ and XCl₃.

Which element is X?

24 W, X, Y and Z are metals. When various mixtures of one of the metals is heated with a metal oxide, the following results were obtained:

(i) oxide of Z + W → oxide of W + Z
(ii) oxide of Y + W → no reaction
(iii) oxide of X + W → no reaction
(iv) oxide of W + Y → no reaction

Which of the following arrangements shows the metals W, X, Y and Z in order of increasing reactivity?

A X Y W Z
B Y X W Z
C W X Y Z
D Z Y W X

25 Metal M forms a chloride MCl₂. M is between copper and silver in the reactivity series.

If a concentrated aqueous solution of MCl₂ is electrolysed, which reactions will occur at the cathode and the anode?

<table>
<thead>
<tr>
<th>Cathode (negative electrode)</th>
<th>Anode (positive electrode)</th>
</tr>
</thead>
<tbody>
<tr>
<td>A M²⁺ + 2e⁻ → M</td>
<td>2Cl⁻ → Cl₂ + 2e⁻</td>
</tr>
<tr>
<td>B M²⁺ + 2e⁻ → M</td>
<td>4OH⁻ → 2H₂O + O₂ + 4e⁻</td>
</tr>
<tr>
<td>C 2H⁺ + 2e⁻ → H₂</td>
<td>2Cl⁻ → Cl₂ + 2e⁻</td>
</tr>
<tr>
<td>D 2H⁺ + 2e⁻ → H₂</td>
<td>4OH⁻ → 2H₂O + O₂ + 4e⁻</td>
</tr>
</tbody>
</table>

26 In the diagram, each cell contains an aqueous solution of a single salt and all four electrodes are platinum.

Electrodes Q and S increase in mass during the electrolysis but no gas is given off at Q or S.

If the increase in mass of Q is greater than the increase in mass of S in the same duration of time, which statement must be true?

A The loss of mass of electrode P is less than the loss of mass of electrode R.
B The current passing through cell 1 is greater than the current passing through cell 2.
C The cation of the solution in cell 1 is different from the cation of the solution in cell 2.
D The cation in cell 1 is the same as in cell 2 but the solution in cell 1 is more concentrated than in cell 2.
27. Gaseous phosphorus pentachloride, \(\text{PCl}_5\), can be decomposed into gaseous phosphorus trichloride and chlorine by heating:

\[
\text{PCl}_5 (g) \rightarrow \text{PCl}_3 (g) + \text{Cl}_2 (g)
\]

The table below gives the bond energies:

<table>
<thead>
<tr>
<th>Bond</th>
<th>Bond energy [kJ/mol]</th>
</tr>
</thead>
<tbody>
<tr>
<td>P-Cl (in both chlorides)</td>
<td>330</td>
</tr>
<tr>
<td>Cl-Cl</td>
<td>240</td>
</tr>
</tbody>
</table>

What is the enthalpy change of the decomposition of phosphorus pentachloride?

A. +60 kJ
B. -90 kJ
C. +420 kJ
D. -420 kJ

28. The diagram shows the energy profile for the decomposition of \(X\) to form products, \(Y\) and \(Z\).

\[
X \rightarrow Y + Z
\]

What statement is correct?

A. The overall enthalpy change is +60 kJ
B. The reaction is exothermic
C. The value of 105 kJ would decrease in the presence of a catalyst.
D. The value of 105 kJ would decrease in the presence of a catalyst.

29. Cracking of hydrocarbons is done to obtain smaller molecules.

Which of the following cracking reactions carried out at the same temperature and pressure will produce the largest volumes of products from one mole of hydrocarbon?

A. \(\text{C}_6\text{H}_{14} (g) \rightarrow 3\text{C}_2\text{H}_4 (g) + \text{H}_2 (g)\)
B. \(\text{C}_6\text{H}_{14} (g) \rightarrow 2\text{C}_2\text{H}_4 (g) + \text{C}_2\text{H}_6 (g)\)
C. \(\text{C}_6\text{H}_{14} (g) \rightarrow 2\text{C}_2\text{H}_4 (g) + 2\text{C}_2\text{H}_6 (g)\)
D. None of the above

31. Petrol and diesel are two common fuels used by cars and buses respectively. The combustion of these fuels produces air pollutants.

The following table shows the mass of pollutants found in the exhaust fume when 1 kg of each fuel is burnt:

<table>
<thead>
<tr>
<th>Pollutant</th>
<th>Petrol kg</th>
<th>Diesel kg</th>
</tr>
</thead>
<tbody>
<tr>
<td>carbon monoxide</td>
<td>14</td>
<td>10</td>
</tr>
<tr>
<td>oxides of nitrogen</td>
<td>30</td>
<td>80</td>
</tr>
<tr>
<td>sulfur dioxide</td>
<td>4</td>
<td>2</td>
</tr>
<tr>
<td>unburnt hydrocarbons</td>
<td>15</td>
<td>23</td>
</tr>
</tbody>
</table>

Which of the following statements can be inferred using the data in the table?

A. Petrol contributes more towards the formation of acid rain
B. The temperature in petrol engine is lower than that in diesel engine
C. All the pollutants listed in the table can be removed by installing a catalytic converter
D. Unburnt hydrocarbons are produced by complete combustion of the fuels
32. The volume of oxygen produced as hydrogen peroxide decomposes was measured over time.

In the first experiment, 100 cm$^3$ of 1.0 mol/dm$^3$ of hydrogen peroxide was used. A graph, labelled X, was obtained, as shown in the diagram below.

![Graph showing volume of oxygen vs time](image)

The experiment was repeated twice with changes in the conditions and graphs Y and Z were obtained.

Which of the following set of changes could possibly produce the results illustrated by graphs Y and Z?

<table>
<thead>
<tr>
<th>Graph Y</th>
<th>Graph Z</th>
</tr>
</thead>
<tbody>
<tr>
<td>A 50 cm$^3$ of 1.5 mol/dm$^3$ of H$_2$O$_2$</td>
<td>150 cm$^3$ of 0.5 mol/dm$^3$ of H$_2$O$_2$</td>
</tr>
<tr>
<td>B 100 cm$^3$ of 1.5 mol/dm$^3$ of H$_2$O$_2$</td>
<td>50 cm$^3$ of 0.5 mol/dm$^3$ of H$_2$O$_2$</td>
</tr>
<tr>
<td>C 60 cm$^3$ of 2.0 mol/dm$^3$ of H$_2$O$_2$</td>
<td>100 cm$^3$ of 0.1 mol/dm$^3$ of H$_2$O$_2$</td>
</tr>
<tr>
<td>D 100 cm$^3$ of 2.0 mol/dm$^3$ of H$_2$O$_2$</td>
<td>60 cm$^3$ of 0.5 mol/dm$^3$ of H$_2$O$_2$</td>
</tr>
</tbody>
</table>

33. Which change would increase the speed of the reaction between 1 mol of two gases?

A. A decrease in surface area of the catalyst
B. A decrease in temperature
C. A decrease in the volume of the reaction flask
D. A decrease in the pressure of the gases

34. The reactivity of Group II metals follows a similar trend to that of Group I metals.

Four Group II metals, P, Q, R, and S, were tested in an electric cell as shown in the diagram below.

![Diagram of an electric cell](image)

The voltage produced is recorded and shown in the following table:

<table>
<thead>
<tr>
<th>Metal</th>
<th>Voltage V</th>
</tr>
</thead>
<tbody>
<tr>
<td>P</td>
<td>0.2</td>
</tr>
<tr>
<td>Q</td>
<td>0.8</td>
</tr>
<tr>
<td>R</td>
<td>0.6</td>
</tr>
<tr>
<td>S</td>
<td>0.4</td>
</tr>
</tbody>
</table>

The four metals tested were magnesium, calcium, strontium, and barium.

What is a possible identity of metal R?

A. magnesium
B. calcium
C. strontium
D. barium

35. Which statements are true about alkenes?

1. Their general formula is C$_n$H$_{2n}$
2. They are saturated
3. They react with halogens

A. 1 and 2 only
B. 1 and 3 only
C. 2 and 3 only
D. 1, 2 and 3
36 What are the reactions of compounds W, X, Y and Z?

<table>
<thead>
<tr>
<th></th>

37 Engine oil is used to lubricate the car engine. Certain polymers are added to engine oil to improve its viscosity.

A portion of the chain of one such polymer is shown below:

\[
-\text{CH}_2\text{CH}-(\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2)\cdot
\]

A molecule of this polymer contains 40 carbon atoms.

How many molecules of monomer are required to form one molecule of this polymer?

A 4
B 5
C 8
D 10

38 The structures of five monomers are shown below.

Which pair of monomers will form a polyamide with the following structure?

A 1 and 2
B 2 and 3
C 2 and 5
D 4 and 6

39 The table shows the composition of four different brands of crude oil namely Arabian Heavy, Arabian Light, Iranian Heavy and North Sea.

When each brand of crude oil undergoes fractional distillation, the percentage of each fraction collected is listed in the table below.

40 Esters are formed when an alcohol reacts with a carboxylic acid.

Which ester would be formed using the carboxylic acid and alcohol shown?

[Diagrams of molecules A, B, C, D are shown.]

- **A**
- **B**
- **C**
- **D**

-**[carboxylic acid] [alcohol]**
Section A (50 marks)

Answer all the questions in the spaces provided.

A1 Choose from the following compounds to answer the questions below.

- BaSO₄
- FeCl₂
- CO₂
- CuCO₃
- CaCO₃
- CF₃Cl
- MgSO₄
- NaCl
- ZnSO₄

Each compound can be used once, more than once or not at all.

State the compound which

(a) is responsible for ozone depletion, [1]

(b) is prepared by titration method, [1]

(c) is an insoluble green solid, [1]

(d) is a product of fermentation, [1]

(e) in aqueous state will react with aqueous barium chloride to give a white precipitate. [1]
A2 The structures of sodium chloride and chlorine are shown below.

(a) The melting point of sodium chloride is 801°C. The melting point of chlorine is −101°C. Explain in terms of bonding and structure, why the melting point of chlorine is so low.

(b) Explain why molten sodium chloride conducts electricity but solid sodium chloride does not.

(c) The reactions occurring at the electrodes when molten sodium chloride is electrolysed are shown below.

Negative electrode: \( \text{Na}^+ + \text{e}^- \rightarrow \text{Na} \)
Positive electrode: \( 2\text{Cl}^- \rightarrow \text{Cl}_2 + 2\text{e}^- \)

With reference to both equations, explain why this electrolysis involves both oxidation and reduction.
A3 Zinc can be extracted from zinc blende, ZnS, or from calamine, ZnCO₃, in a two-stage process.

Stage 1

\[ 2\text{ZnS} + 3\text{O}_2 \rightarrow 2\text{ZnO} + 2\text{SO}_2 \]  
\[ \text{ZnCO}_3 \rightarrow \text{ZnO} + \text{CO}_2 \]

Stage 2

\[ \text{ZnO} + \text{C} \rightarrow \text{Zn} + \text{CO} \]

(a) Explain why the gas from stage 2 must be removed for the safety of the workers.

(b) Explain why the reactions in the two-stage process cannot be used to extract sodium from sodium carbonate, Na₂CO₃.

(c) Industrial processes release large amounts of sulfur dioxide and carbon dioxide into the atmosphere.

(i) State a natural source of sulfur dioxide.

(ii) Carbon dioxide contributes to global warming. Describe one environmental consequence of an increase in global warming.
(d) The zinc obtained in stage 2 has to be purified further for more useful purposes.

One of the most common uses for zinc is as an anti-corrosion agent.

Explain why zinc is able to act as an anti-corrosion agent in galvanized steel lamp posts.

(e) The most abundant and stable zinc isotope is $^{66}\text{Zn}$

State the number of protons and neutrons in this isotope of zinc.

Number of protons

Number of neutrons

[1]

[2]
Sulfamic acid, $\text{SO}_2\text{NH}_2$, is a weak acid used to remove limescale, deposited calcium carbonate, from kettles.

(a) Explain the meaning of the term weak acid.

(b) The pH of an aqueous solution of sulfamic acid can be determined using a pH meter. Describe another way of estimating the pH of a solution of sulfamic acid.

(c) A 0.105 g sample of sulfamic acid is dissolved in some water. This sulfamic acid solution requires 10.8 cm$^3$ of 0.100 mol/dm$^3$ potassium hydroxide for complete neutralisation. Calculate the number of moles of sulfamic acid that react with one mole of potassium hydroxide.

(d) Aqueous sulfamic acid reacts with magnesium to form magnesium sulfamate, $\text{Mg(SO}_2\text{NH}_2)_2$.

(i) Write an equation for this reaction.
(ii) Limescale contains calcium carbonate.

Describe, with the aid of an equation, what is observed when aqueous sulfamic acid reacts with calcium carbonate.

\[ \text{N}_2(\text{g}) + 3\text{H}_2(\text{g}) \rightleftharpoons 2\text{NH}_3(\text{g}) \]

A5 Ammonia is a compound of hydrogen and nitrogen with a formula of NH₃. It is a colourless gas with a pungent smell. The formation of ammonia is made by reacting nitrogen and hydrogen in a reversible reaction as shown in the equation below.

(a) The reaction to produce ammonia can be demonstrated in the science laboratory by the method shown in the diagram below:

75cm³ of hydrogen | iron wool | 25cm³ of nitrogen

gas syringe | HEAT STRONGLY | gas syringe

The mixture of nitrogen and hydrogen is passed backwards and forwards over the hot iron wool until there is no further reaction.

(i) Explain why air must not be present in the above reaction.

(ii) Assuming only 15% of the nitrogen and hydrogen react to produce ammonia, calculate the volume of ammonia produced at room temperature and pressure.
(b) In industries, ammonia is manufactured in the Haber Process. The table below shows the percentage yield of ammonia at different temperature and pressures.

<table>
<thead>
<tr>
<th>Temperature°C</th>
<th>Percentage yield of ammonia at equilibrium</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>

<td>24</td>
</tr>
<tr>
<td>450</td>
<td>20</td>
</tr>
<tr>
<td>550</td>
<td>10</td>
</tr>
</tbody>
</table>

(i) State how the increase in pressure affects the percentage yield of ammonia at equilibrium.

(ii) Suggest one advantage and one disadvantage of using 450°C rather than 350°C as the working temperature.

(iii) Explain why the use of expensive metals as catalyst does not increase the cost of production of ammonia in the Haber Process.
A6 Hydrogen peroxide, \( \text{H}_2\text{O}_2 \), is a covalent compound. Hydrogen peroxide decomposes to form water and oxygen according to the equation:

\[
2\text{H}_2\text{O}_2 (l) \rightarrow 2\text{H}_2\text{O} (l) + \text{O}_2 (g)
\]

(a) The decomposition of hydrogen peroxide involves a change from the liquid state to the gaseous state.

Describe the difference in both the movement and arrangement of particles in a liquid and in a gas.

Movement:

Arrangement:

(b) Complete the 'dot and cross' diagram to show the bonding present in hydrogen peroxide, \( \text{H}_2\text{O}_2 \), using the legend stated.

![Diagram of bonding in hydrogen peroxide with symbols for electrons and atoms]

Key:

\( x \): electrons of oxygen atoms

\( \bullet \): electrons of hydrogen atoms

[2]
(c) Hydrogen peroxide can act as an oxidising agent or a reducing agent.

Deduce the nature of hydrogen peroxide in each test described.

A7 The following energy profile diagram shows the differences in amount of energy associated with the combustion of glucose, $C_6H_{12}O_6$, during cellular respiration to produce carbon dioxide and water.

![Energy Profile Diagram]

(a) Calculate the enthalpy change, $\Delta H$, of the reaction.
(b) Explain whether this reaction is endothermic or exothermic in terms of bond breaking and bond forming.

(c) Calculate the energy released per gram of glucose.
Crude oil is a raw material which is processed in an oil refinery. Two of the processes used are fractional distillation and cracking.

The table below shows the percentage of the supply and demand of each fraction in crude oil.

<table>
<thead>
<tr>
<th>Fraction</th>
<th>Number of carbon atoms per molecule</th>
<th>Percentage of supply in crude oil</th>
<th>Percentage of demand in crude oil</th>

</tbody>
</table>

(a) State the physical property which is used to separate crude oil by fractional distillation.

(b) Use the information from the table to

(i) identify the fractions that would undergo cracking to meet the demand for petrol.

(ii) explain your choice in (i)
(c) Heptane, an alkane with 7 carbon atoms, can be cracked into smaller molecules under high temperatures and a catalyst.

A large volume of heptane was subjected to cracking and the main product was methane. Gas B which has a relative molecular mass of 28 was also isolated in the product mixture and was found to be unsaturated.

(i) Write an equation to show the cracking process.

(ii) Describe a chemical test that can be used to distinguish between methane and gas B.
Section B (30 marks)

Answer all three questions in this section.
The last question is in the form of EITHER/OR and only one alternative should be attempted.

B9 Aqueous chlorine dioxide, a yellow solution, reacts with an alkali according to the following equation:

$$2\text{ClO}_2\text{(aq)} + 2\text{OH}^-\text{(aq)} \rightarrow \text{ClO}_3^-\text{(aq)} + \text{ClO}_2^-\text{(aq)} + \text{H}_2\text{O}\text{(l)}$$

Yellow

A student carried out different experiments to investigate the rate of reaction using different concentrations of aqueous chlorine dioxide and alkali. In each experiment, she measured how quickly the colour of aqueous chlorine dioxide disappeared.

The table showed the results obtained with differing concentrations of aqueous chlorine dioxide and alkali used in each experiment.

<table>
<thead>

</tbody>
</table>

The reaction of aqueous chlorine dioxide with alkali is interesting because it is an example of a disproportionation reaction. Disproportionation happens when the oxidation state of the same element both increases and decreases in the reaction.

(a) Describe the trend in the rate of reaction with respect to the concentration of the reagents used.

Explain and justify your answer using the results in the table, stating clearly the experiment number you are using for each reagent.

[3]
(b) Using Collisions Theory, explain the trend stated in (a).

(c) Two students have different opinion about the data.

Student 1: I think that the rate of reaction depends on the concentration of aqueous chlorine dioxide to a greater extent.

Student 2: I think that the rate of reaction depends on the concentration of alkali to a greater extent.

Who do you agree with? Explain your answer using results from the table. State which experiment number you are using, and show clearly how you arrived at your answer.

(d) Predict the rate of the disappearance of ClO₂ if the experiment was conducted using 0.040 mol/dm³ of ClO₂ and 0.120 mol/dm³ of OH⁻.

(e) Use the idea about oxidation state to explain why the reaction of chlorine dioxide with an alkali is a disproportionation reaction.
B10 Electrolysis can be used to remove unwanted hair. The customer holds a metal bar which acts as a positive electrode. A needle, which acts as the negative electrode, is held by the operator.

(a) The solution around the tip of the needle is very dilute aqueous sodium chloride.

(i) Explain why very dilute aqueous sodium chloride is used instead of pure water.

(ii) Give the formulae of all the ions present in very dilute aqueous sodium chloride during this electrolysis.
(iii) During electrolysis, a small amount of gas is formed at the surface of the skin.

Name the gas formed and write a half equation for the formation of gas.  

[2]

(iv) During electrolysis, hydrogen gas is also formed at the tip of the negatively charged needle. The formation of gas caused the pH of the remaining solution to change.

Explain why the formation of the gas caused the pH of the remaining solution to change.  

[2]

(b) During the hair removal by electrolysis, the metal bar held by the customer acts as an electrode.

Two different experiments are set up by a student to electroplate the metal bar used with silver to improve its appearance.

Experiment 1

- Anode: carbon rod
- Cathode: metal bar to be plated
- Aqueous silver nitrate (AgNO₃(aq))
- Oxygen gas

Experiment 2

- Anode: silver rod
- Cathode: metal bar to be plated
- Aqueous silver nitrate (AgNO₃(aq))

At the beginning of each experiment, a sample of the electrolyte, aqueous silver nitrate, is removed and placed in a test-tube. A few drops of aqueous sodium chloride are then added to the sample of electrolyte.

(i) Describe what the student sees in the test tube.  

[1]
(ii) After some time, it is observed that when no more silver is being deposited on the metal bar in experiment 1, more silver is still being deposited on the metal bar in experiment 2.

Suggest a reason for this observation. Predict what the student will see if aqueous sodium chloride is added to the electrolyte in experiment 1.

[Total: 10]
EITHER

B11 (a) PMMA is a member of a family of polymers known as acrylics. It is a clear plastic and is often used as a shatterproof replacement for glass. It is formed from a single monomer, methyl methacrylate, that has the following structure:

\[
\begin{align*}
\text{O} & \\
\text{H}_3\text{C} & \quad \text{C} \quad \text{C} \quad \text{O} \quad \text{CH}_3 \\
\text{H} & \quad \text{C} \quad \text{H} \\
\end{align*}
\]

(i) State the actual name of PMMA.

(ii) Draw the structure of PMMA with 3 repeat units.

(iii) Name the reaction that is used to form PMMA.
(b) PLGA is another polymer which is used in manufacturing staples for closing surgical wounds. PLGA is synthesized by means of polymerisation of two different monomers, lactic acid and glycolic acid. Lactic acid and glycolic acid can be found in food.

\[ \text{PLGA} \]

\[ \text{glycolic acid} \]

(i) State the type of polymer the PLGA is classified as.

(ii) State the functional groups in the monomers that react to form PLGA.

(iii) Draw the full structural formula of lactic acid.

(iv) Name the reaction and draw the full structural formula of the molecule formed when glycolic acid is left in the air for a long period of time.

Full structural formula

(v) Name one advantage of using PLGA.

[Total: 10]
OR

B11 Perfumes usually contain three groups of compounds called the top note, the middle note and the end note

(a) Top notes consist of small, light molecules that evaporate quickly. An example of a top note compound is styralyl acetate as shown below:

\[
\begin{array}{c}
\text{CH}_3 \\
\text{C} - \text{O} \quad \text{C} - \text{CH}_3 \\
\text{H}
\end{array}
\]

top note

(i) With reference to the structure of the compound, explain why it is likely to have a pleasant smell.

........................................................................................................................................
........................................................................................................................................
........................................................................................................................................
........................................................................................................................................

(ii) Draw the structural formula of the alcohol and carboxylic acid used to make styralyl acetate.
(b) The middle note compounds form vapours less rapidly than the top note compounds. A typical compound of the middle note is 2-phenylethanol. The structure of 2-phenylethanol is shown below.

\[ \text{C}_6\text{H}_5\text{CH}_2\text{CH}_2\text{OH} \quad \text{middle note} \]

(i) Describe a chemical test which would distinguish between the top note and the middle note compounds

(ii) Name and draw the full structural formula of the molecule formed in the positive test in (i).

Full structural formula

[2]
(c) The end note compound of a perfume has a long lasting odour which stays with the user. An example of an end note compound is shown below.

![Chemical structure of end note compound]

(i) Explain why the end note compound is described as unsaturated.

(ii) The end note compound undergoes hydrogenation reaction.  
State the conditions that are essential for the hydrogenation reaction.

(iii) Iodine reacts with unsaturated compounds. The iodine value is a measure of how unsaturated a compound is. It is based on the mass, in g, of iodine that reacts with 100 g of the compound.

The relative molecular mass of the end note compound is 250.

Calculate the iodine value for the end note compound.

</table>
METHODOIST GIRLS' SCHOOL
SECONDARY FOUR PRELIM EXAMINATION (2015)

Section A

1 (a) CF₂Cl 1

(b) NaCl 1

(c) CuCO₃ 1

(d) CO₂ 1

(e) ZnSO₄ / MgSO₄ 1

2 (a) Chlorine has a simple molecular structure and exists as molecules. There are weak intermolecular forces of attraction between the chlorine molecules hence little energy is needed to overcome these forces, thus the melting point of chlorine is low.

(b) Molten sodium chloride has mobile ions but the ions in solid sodium chloride are held in fixed positions, hence it cannot move to conduct electricity.

(c) Sodium ions gain electrons to form sodium ions. The oxidation state of sodium increases from +1 in sodium to 0 in sodium oxide. The oxidation state of chlorine decreases from -1 in chlorine ion to 0 in chlorine.

3 (a) CO is poisonous as it poisons the haemoglobin in the red blood cells to form carbonmonoxyhaemoglobin, which prevents transport of oxygen to other parts of the body.

(b) Stage 1: Sodium carbonate cannot be decomposed by heat as it is a very stable compound.

Stage 2: Sodium oxide cannot be reduced to by carbon. Electricity is needed to break the strong ionic bonds between sodium ions and oxide ions.

OR Carbon is not reactive enough to break the strong ionic bonds in sodium oxide.

(c)(i) Volcanic eruptions 1

(c)(ii) Flooding of low-lying areas as sea level rise due to melting ice caps.

OR

Extreme changes in global climate. The rise in temperature will cause more food losses to be extreme droughts, resulting in decrease in crop yields/food shortages/drought.

4 (a) A weak acid is a substance that when dissolved in water dissociates partially to give hydrogen ions.

(b) Use universal indicator to detect that the different colours indicate different pH values/match colour against a colour chart. (Allow this mark even for an incorrect indicator).

(c) No of moles of sulfuric acid = 0.105/97 = 0.00102

No of moles of KOH = 10 g/1000 g = 0.00108

Thus, 1 mole of sulfuric acid reacts with 1 mole of KOH.

(d)(i) Mg + 2SO₄⁻Na⁺ -> MgSO₄ disposal + H₂ 1

(d)(ii) CuCO₃ + 2SO₄⁻Na⁺ -> Cu(SO₄)₂ + Na₂CO₃ 1

Bubbles of gas formed when sulfuric acid reacts with calcium carbonate.

5 (a)(i) Hydrogen burns in air to release a lot of heat energy. Oxygen in the air will react with the heated iron to form iron oxide.

(a)(ii) Volume of NH₃ formed if 100% conversion = 25 x 2 = 60cm³

If only 15% converted, volume of NH₃ formed = 60 x 16/100 = 7.3cm³

(b)(i) As pressure increases, the % yield of ammonia increases.

(b)(ii) Advantage: higher temperature, the rate of reaction will increase faster.

Disadvantages: lower % yield of ammonia.

(b)(iii) Only a small amount is needed, can be recycled/catalyst remains unchanged at the end of the reaction, hence can be recovered if used as catalyst.
6 (a) Movement: The particles in the liquid move and slide in and throughout each other while the particles in the gas move randomly and at high speed in all directions.

Arrangement: The particles in the liquid are closely packed but arranged in a disordered manner / irregular arrangement. The particles in the gas are far apart.

![Diagram of H2O molecule]

1m for correct covalent bond between H and O
1m for correct correctly shown valence electron in O

(b) \( \text{C}_3\text{H}_8 \rightarrow \text{CH}_4 + 3\text{C}_2\text{H}_4 \)

(c) (i) Diesel oil, waxes and bitumen

(ii) Lower in demand compared to percentage of supply. Hence the excess can be used for cracking to form petrol.

(ii) Bubble the gases separately into aqueous bromine / bromine solution. Gas A turns reddish-brown, aqueous bromine colourless whereas aqueous bromine remained reddish-brown when methane was bubbled into it.

7 (a) Enthalpy change of reaction = 2987 - 181 = -2806 kJ/mol

Students need to give the negative sign, to be awarded the 1m.

(b) Endothermic.

More energy is released to make the bonds in water and carbon dioxide than energy taken in to break the bonds in glucose and oxygen.

(c) 1 mole contains 180g of glucose (which contains 2816 kJ energy)

1 g of glucose contains \( \frac{2816}{180} \approx 15.68 \) kJ of energy
Answer Scheme for Section B

B8 (a) As the concentration of the reagent increases, the rate of reaction also increases.
Comparing experiment 2, 4 and 5, while keeping the concentration of aqueous chlorine dioxide the same, as the concentration of aqueous sodium hydroxide/hydroxide ion increases, the rate of disappearance of aqueous chlorine dioxide also increases.
Comparing experiment 1, 2 and 6, while keeping the concentration of aqueous sodium hydroxide/hydroxide ion the same, as the concentration of aqueous chlorine dioxide increases, the rate of disappearance of aqueous chlorine dioxide also increases.
1m for stating the general trend
1m for comparing the correct experiment
1m for mentioning that keeping concentration of the other reagent the same

(b) When the concentration of aqueous chlorine dioxide or hydroxide ions increases, the number of aqueous chlorine dioxide particles or hydroxide ions per unit volume increases or the number of moles of aqueous chlorine dioxide particles or hydroxide ions per unit volume increases. This causes an increase in the frequency of effective collisions, hence, the rate of reaction also increases.
Comparing experiment 1 and 2, when the concentration of aqueous chlorine dioxide is doubled, the rate of disappearance increased by 4 times.
Comparing experiment 2 and 4 or 1 and 3, when the concentration of aqueous sodium hydroxide/hydroxide ion is doubled, the rate of disappearance increased by 2 times (or doubles). Hence, I agree with student 1.
Comparing experiments 2 and 5, when the concentration of aqueous chlorine dioxide is tripled, the rate of disappearance increased by 9 times.
Comparing experiment 2 and 6, when the concentration of aqueous sodium hydroxide/hydroxide ion is tripled, the rate of disappearance increased by 3 times.
Hence, I agreed with student 1.
1m for stating 2 pairs of experiment number
1m for working

(d) Rate of disappearance
= \( \text{rate} = \frac{1 \text{ mol}}{\text{dm}^3 \cdot \text{s}} \)
= \( 0.02208 \times 2 \)
= 0.04416 \text{ mol dm}^{-3} \text{s}^{-1}

(b) The oxidation state of chlorine increased from +4 in ClO\(_2\) to +5 in ClO\(_3\).

B10 (a) (i) Dilute aqueous sodium chloride contains soluble ions OR Pure water does not contain mobile charged particles.

EITHER

B11 (a) (i) Polymethylmethacrylate 1
(ii) Polyurethane 1

(iii) Addition polymerisation 1

(b) (i) PLGA is a condensation polymer. 1
(ii) The monomers must have hydroxyl and hydroxyl functional groups (Both correct award 1 m)
**B11** (a) (i) The compound consists of a functional group named ester

(ii) Alcohol

![Chemical structure](image)

Carboxylic acid

(b) (i) Add acidified potassium permanganate(VII) solution to each sample of top note compound and middle note compound.

If the acidified potassium permanganate(VII) solution turned from purple to colorless, the sample is middle note.

If the acidified potassium permanganate(VII) solution remained purple, the sample is top note.

OR

Add acidified potassium dichromate(V) solution to each sample, if the solution turned from orange to green, the sample is middle note or if the solution remained green, the sample is top note. 1m for test, 1m for the observation

(iii) 2-phenylethanol acid
1. The table below shows a list of elements and the symbols for their atoms.

<table>

3 The experimental set-up shown below is used to collect the gaseous product of the reaction between iron filings and dilute hydrochloric acid

Which of the following statements about the experimental set-up is incorrect?

A. Concentrated sulfuric acid acts as the drying agent.
B. The gas jar is inverted to collect a gas that is of low density.
C. The iron filings can be replaced with magnesium to produce the same gas.
D. It is not necessary to ensure that the end of the thistle funnel is immersed in the hydrochloric acid.

4 Which of the following mixtures would be best separated using fractional distillation?

A. butane and water
B. butanol and water
C. ethyl ethanoate and water
D. berlitz carbonate and water

5 You are asked to separate a suspension of silver chloride in a solution of potassium chloride and ammonium chloride so as to obtain all three substances. To do this, the following processes can be used: evaporation, filtration and sublimation. In which order should you carry out these processes?

A. sublimation, filtration, evaporation
B. sublimation, evaporation, filtration
C. filtration, evaporation, sublimation
D. filtration, sublimation, evaporation

6 The formulas of two substances are given as Co(NO₃)₂ and Co(NO₃)₃. Which statement is true?

A. The two substances are mixtures of cobalt, nitrogen and oxygen.
B. The elements are different in the two substances.
C. Both substances are compounds.
D. The percentage of cobalt is the same in both substances.

7 In an experiment, a solid X is found to melt at 121°C, the same temperature as the melting point of benzoic acid. To check the identity of the solid, some of it is mixed with pure solid benzoic acid. The melting point of the mixture is found to be 115°C. From this, it can be deduced that X is

A. a mixture.
B. a pure compound.
C. not benzoic acid.
D. impure benzoic acid.

8 An ion of element X has 22 electrons and a mass number of 55. What is the charge on the ion if the number of neutrons is 30?

A. +2
B. -2
C. +3
D. -3

9 Selenium is a chemical element with symbol Se. It was discovered in 1817 and has an electronic configuration 2 8 18 6. What is the electronic configuration of the selenium ion?

A. 2 8
B. 2 8 18 6
C. 2 8 18 6
D. 2 8 18 2

10 Which one of the following is a compound consisting of small molecules?

A. natural gas
B. lithium
C. heptane
D. diamond
11 A mixture of silicon and magnesium was added to a beaker of excess dilute hydrochloric acid as shown in the diagram below. At the end of the reaction, the mixture was filtered to obtain the silicon as residue.

Which of the following options indicates correctly the type of particles present in the substances shown in the diagram?

<table>

19 A mixture of magnesium bromide and magnesium sulfite is known to contain 3 moles of magnesium ions and 4 moles of bromide ions. How many moles of sulfite ions are present?

A 1
B 2
C 3
D 4

20 Tartaric acid is a dibasic acid and its salts are used in food. The molecular formula of tartaric acid is $\text{C}_4\text{H}_6\text{O}_5$. What are the possible formulas of the salts formed by tartaric acid?

A $\text{K}_3\text{C}_4\text{H}_6\text{O}_5$ and $\text{Al}_2(\text{H}_2\text{C}_4\text{O}_4)_3$
B $\text{Fe}_2\text{C}_4\text{H}_6\text{O}_5$ and $\text{Li}_2\text{C}_4\text{H}_6\text{O}_5$
C $\text{Ba}_2\text{C}_4\text{H}_6\text{O}_5$ and $\text{Li}_2\text{C}_4\text{H}_6\text{O}_5$
D $\text{Na}_2\text{C}_4\text{H}_6\text{O}_5$ and $\text{Na}_2\text{C}_4\text{H}_6\text{O}_5$

21 When solutions of lead(II) nitrate and potassium iodide are mixed, lead(II) iodide is precipitated. The equation for the reaction is as follows:

$$\text{Pb(NO}_3)_2 + 2\text{KI} \rightarrow \text{PbI}_2 + 2\text{KNO}_3$$

Different volumes of 1.0 molar aqueous potassium iodide (P) are added to the same volume of 0.5 molar aqueous lead(II) nitrate (L) in each of five test-tubes as shown above. When the precipitates settle, it is found that the amount of precipitate are the same in all five test-tubes.

A Increase stepwise from tube 1 to tube 5
B Increase from tube 1 to tube 2, but are the same in tubes 2 to 5
C Increase from tube 1 to tube 3, but are the same in tubes 3 to 5
D Increase from tube 1 to tube 6

22 Disproportionation reactions occur when an element is simultaneously oxidized and reduced. The oxidation number of the element will change to both a higher value and a lower value respectively. Which of the following named elements does not undergo disproportionation?

23 In which of the following reactions does $\text{Fe}^{3+}(aq)$ act as a reducing agent?

A $\text{Fe}^{3+}(aq) + \text{Mg}(s) \rightarrow \text{Fe}(s) + \text{Mg}^{2+}(aq)$
B $4\text{Fe}^{3+}(aq) + 3\text{SO}_3^{2-}(aq) + 2\text{H}_2\text{O}(l) \rightarrow 4\text{Fe}^{2+}(aq) + 3\text{SO}_4^{2-}(aq) + 4\text{H}^+(aq)$
C $\text{Fe}^{3+}(aq) + 2\text{OH}^-(aq) \rightarrow \text{Fe}(s) + \text{H}_2\text{O}(l)$
D $\text{Fe}(s) + 2\text{H}^+(aq) \rightarrow \text{Fe}^{2+}(aq) + \text{H}_2(g)$

24 Metal X is placed between zinc and iron in the reactivity series. Which prediction can be made about metal X?

A Metal X displaces magnesium from an aqueous solution of a magnesium salt.
B Metal X reacts with dilute hydrochloric acid to produce oxygen.
C Metal X forms a hydroxide which is insoluble in water.
D Metal X is extracted from its ores by electrolysis.

25 The table shows the results of adding weighed pieces of zinc metal in salt solutions of metal P, Q, and R.

<table>
<thead>
<tr>
<th>Salt solution of metal</th>
<th>Initial mass of zinc/g</th>

Which of the following shows the correct arrangement of metals in decreasing reactivity?

A P, R, zinc, Q
B R, P, zinc, Q
C Q, zinc, P, R
D Q, zinc, R, P

26 In an experiment, 6 moles of magnesium ions were discharged in the electrolysis of molten magnesium chloride. Which amount of metal would be discharged by the same amount of electricity in the following experiments?

A 3 moles of copper(II) ions in the electrolysis of aqueous copper(II) sulfate
B 6 moles of zinc ions in the electrolysis of aqueous zinc chloride.
C 12 moles of calcium ions in the electrolysis of molten calcium fluoride.
D 12 moles of lithium ions in the electrolysis of molten lithium bromide.
27 Cadmium is a metal used to make rechargeable batteries. The purification of cadmium by electrolysis is shown below. Cadmium and zinc form ions with the same electric charge.

The following results were obtained from an investigation of this process:

<table>
<thead>
<tr>
<th>mass of pure cadmium electrode/g</th>
<th>mass of impure cadmium electrode/g</th>
</tr>
</thead>
<tbody>
<tr>
<td>at start of electrolysis</td>
<td>140</td>
</tr>
<tr>
<td>at end of electrolysis</td>
<td>781</td>
</tr>
</tbody>
</table>

The percentage of zinc in the impure cadmium is ________

A 66.7%
B 16.3%
C 23.3%
D 93.3%

28 Carbon and silicon are in the same group of the Periodic Table. Which of the following formulas is incorrect?

A CaSiO₂
B SiH₄
C SiCl₄
D HSiCl₃

29 Astatine (A) is a member of the halogen family. It has a proton number greater than the other halogen. It is expected that astatine

A is a coloured liquid at room temperature
B is the halogen with the weakest oxidizing power
C has the lowest melting point
D is the most reactive halogen

30 Study the following equation:

\[ C_8H_{18} \rightarrow C_8H_2 + C_6H_6 \quad \Delta H = +110kJ \]

Which of the following statements is correct?

A It is a substitution reaction
B The heat of combustion is 110kJ per mole of octane
C The cracking process takes in heat energy
D The bond breaking process is exothermic

31 Methane reacts very slowly with air at room temperature. But if a transition metal T is added to the methane-air mixture, the methane ignites. The addition of T

I reduces the activation energy.
II increases the \( \Delta H \).
III increases the rate of reaction.
IV reduces the energy of the reactants.

A I and II only
B II and III only
C I and III only
D All of the above

32 Which of the following conditions will cause the highest rate of reaction between the diethylene and zinc?

A 10g of zinc lumps and 50 cm³ of 1mol/dm³ HCl
B 10g of zinc powder and 50 cm³ of 1mol/dm³ HCl
C 10g of zinc lumps and 50 cm³ of 0.5mol/dm³ H₂SO₄
D 10g of zinc powder and 25 cm³ of 1mol/dm³ H₂SO₄

33 Potassium chlorate solution decomposes according to the equation shown:

\[ 2KClO₃(aq) \rightarrow 2KCl(aq) + 3O₂(g) \]

If 50cm³ of water is added to the potassium chlorate solution before the reaction begins, what effect will it have on the rate of the reaction and the volume of oxygen produced?

A Both the rate of reaction and the volume of oxygen produced will decrease.
B The rate of reaction will increase but the volume of oxygen produced will decrease.
C The rate of reaction will decrease but the volume of oxygen produced will remain unchanged.
D The rate of reaction will remain unchanged but the volume of oxygen produced will decrease.
34 Which fertilizer provides the most nitrogen per kg?
   A NH₄NO₃
   B NaNO₃
   C (NH₄)₂SO₄
   D NH₄H₂PO₄

35 Air samples collected from the Central Expressway tunnels were analysed. Which of the following substances are likely to be present in the air samples?
   I CO
   II C₆H₁₃
   III NOₓ
   IV C₂H₄
   A I and II
   B I and III
   C I, II and III
   D I, II, III and IV

36 When a mixture consisting of C₂H₂, C₂H₆, C₃H₈ and C₄H₁₀ undergoes fractional distillation, the fraction that is collected at the highest in the column is richer in
   A C₂H₂
   B C₂H₆
   C C₃H₈
   D C₄H₁₀

37 What is the total number of straight chain and branched chain isomers for the organic molecule pentane?
   A 3
   B 4
   C 5
   D 6

38 Which of the following statements about the alkyne series of hydrocarbons, C₃H₇₋₂₋₃₋₂₋₃ is true?
   A The hydrocarbons are saturated.
   B The relative molecular masses of successive members in the series differ by 12.
   C The boiling point of alkyne decreases as n increases.
   D Alkyne decolourises aqueous bromine rapidly.

39 Aspirin is one of the most widely used pain relievers in the world. It has the structure as shown:

```
  O
 /\ /
|  |
C-C-C
\|/ \|
 |  |
H-C-C
```

From the structure, we can deduce that aspirin
   A will turn phenolphthalein pink.
   B reacts with ethanoic acid to form an ester.
   C will produce carbon dioxide when reacted with a carbonate.
   D is an unsaturated hydrocarbon.

40 Part of a polymer is shown below. Which pair of alkenes was used as monomers?

```
  H  C₃H₇  H  H  C₂H₆  H  
  H  H  H  H  H  H  H  
  H  H  H  H  H  H  H  
  H  H  H  H  H  H  H  
```

   A ethene and propene
   B propene and but-1-ene
   C ethene and but-1-ene
   D propene and but-2-ene

Key:

- X: Main Group
- A: Actinide

The volume of one mole of any gas is 22.4 dm³ at room temperature and pressure (1 atm).
READ THESE INSTRUCTIONS FIRST

Write your name, class and register number in the spaces provided on the question paper.  
Write in dark blue or black pen.  
You may use a pencil for any diagrams or graphs.  
Do not use staples, paper clips, glue or correction fluid.  
The use of an approved scientific calculator is expected, where appropriate.

Section A: Structured Questions [50 marks]  
Answer all questions. Write your answers in the spaces provided on the question paper. All working must be shown clearly.

Section B: Data-based and Free-response Questions [30 marks]  
Answer all three questions in this section. The last question is in the form of an either/or and only one of the alternatives should be attempted. Start each question on a fresh piece of paper. Fasten your answers securely together.

The number of marks is given in brackets [ ] at the end of each question or part question.  
The total marks for this paper is 80.  
A periodic table is provided on page 14.

Setter: Mr J. Chua  
Verter: Mr Tien CW & Mrs Hay MH

This paper consists of 14 printed pages including the cover page.
Section A: Structured Questions [50m]
Answer all questions in this section in the spaces provided.

A1 Carbon has fifteen known isotopes ranging from carbon-8 to carbon-22.

a) Explain what is meant by isotopes. [1]

b) Complete the table below with the correct number of subatomic particles. [6]

<table>
<thead>
<tr>
<th>Isotope</th>
<th>Number of protons</th>
<th>Number of electrons</th>
<th>Number of neutrons</th>
</tr>
</thead>
<tbody>

</tr>
</tbody>
</table>

c) Carbon-14 is formed in the upper layers of the atmosphere where a free moving nitrogen atom collides with a very energetic neutron in the reaction below, giving off a particle from its nucleus.

$$^{14}N + n \rightarrow ^{14}C + \text{Particle } X$$

i) Name particle X. [1]

ii) Name another particle that is formed in the upper layers of the atmosphere which is responsible for the destruction of the ozone layer. [1]

d) Due to carbon's special electronic configuration, it is able to form a wide variety of compounds, both organic and inorganic, with many other elements.

i) When carbon reacts with oxygen, an inorganic compound, carbon dioxide is formed. Draw a dot-and-cross diagram for carbon dioxide, showing only the valence electrons. [2]
i) When methane undergoes substitution reaction with chloromethane, dichloromethane is formed as one of the organic products. Draw a dot-and-cross diagram for dichloromethane, showing only the valence electrons. [2]

A2 Iron is extracted from haematite ore industrially in a blast furnace as shown below.

![Diagram of blast furnace]

a) Fill in the blanks in the diagram above. [4]

b) Write a balanced chemical equation with state symbols for the reduction of haematite by the gases in the blast furnace. [2]

[c] Assuming a yield of 65%, calculate the mass of iron that can be extracted from 10 tonnes of haematite ore. [1 tonne = 1000 kg] [2]
d) Due to contamination of the ore with sulfur, sulfur dioxide is often formed and released into the atmosphere with the waste gases

i) Suggest one harmful effect on the environment by releasing large amount of sulfur dioxide into the atmosphere. [1]

ii) Name a process that can remove sulfur dioxide from the waste gases and write the chemical equation for the reaction. [2]

iii) Name one other possible air pollutant that can be present in the waste gases. [1]

e) Vibranium is a fictional metal that is used to make Captain America's shield. An excerpt below explains how vibranium makes the shield almost indestructible.

"Vibranium has the unique property to absorb all vibrations as well as kinetic energy directed at it. The energy absorbed is stored within the bonds between the molecules that make up the substance. Using the shield made of vibranium alloy, Captain America is able to cut through other metals."

i) State the wrong concept from the bolded sentence in the excerpt above and explain why it is incorrect. [2]

ii) Draw a well-labelled diagram of the likely structure of Vibranium. [3]
iii) Name an alloy that can also be used for the same function as Vibranium as mentioned in the excerpt.

A3 Beaverina sets up the following circuit using different metals as electrodes in an investigation.

![Electrolysis Circuit Diagram]

Dilute copper (II) sulfate solution

a) Suggest which beaker is functioning as the simple cell in the set-up above.

b) Draw arrows on both wires to show the flow of electrons in the circuit above.

c) Complete the table below to predict the observations made.

<table>
<thead>
<tr>
<th>Location</th>
<th>Observations</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

d) Write the equation for the reaction occurring at electrode B.

e) Predict one change to the observation made at electrode A, if any, when the zinc electrode is replaced by a magnesium electrode.
A4 Sodium sulfite (Na₂SO₃) is often added to preserve food. The amount of sodium sulfite in a piece of meat can be determined through a series of tests shown below.

Step 1: Boil the meat with hydrochloric acid to form sodium chloride, water and sulfur dioxide.
Step 2: Collect gas produced and bubble it through 100 cm³ of water to dissolve sulfur dioxide.
Step 3: Titrate the solution obtained against iodine according to the following reaction.

\[ \text{SO}_2 \text{(aq)} + 2\text{H}_2\text{O} \text{(l)} + \text{I}_2 \text{(aq)} \rightarrow 4\text{H}^+ \text{(aq)} + \text{SO}_4^{2-} \text{(aq)} + 2\text{I}^- \text{(aq)} \]

a) Write a balanced chemical equation for the reaction in Step 1. [1]

b) Describe a chemical test to determine if there is any sulfur dioxide present after the gas has been bubbled through water in Step 2. [2]

c) It was noted that 12.00 cm³ of 0.0250 mol/dm³ of iodine was required for complete reaction in the titration.

i) Calculate the volume of SO₂ produced in Step 2. [2]

ii) Explain, using oxidation states, why the titration in Step 3 involves a redox reaction. [2]
A5 Phase diagram is a chart which shows the physical states of a substance at various temperature and pressure. The chart is divided into regions where the substance exists as a solid, liquid or gas.

The bolded lines in the diagram that separate the regions are known as phase boundaries, where the substance changes from one state to another. Shown below is a phase diagram of carbon dioxide and some of its physical states at various pressure and temperature.

<table>
<thead>
<tr>
<th>Pressure [atm]</th>

</tbody>
</table>

a) Carbon dioxide is being stored under a pressure of 1 atm. Suggest the temperature that it should be kept at such that it is in a solid state. [1]

b) Name the physical process that occurs along the phase boundary from point A to point B. [1]
c) Using the idea of kinetic particle theory, state what happens to the arrangement and movement of the particles of carbon dioxide when it is heated from point C to D under constant pressure [2]
Section B: Essay Question [30m]
Answer all three questions in this section. The last question is in the form of an either/or and only one of the alternatives should be attempted.
Begin each question on a fresh page with its question number clearly written.

B6) Although solids of ionic compounds are generally known to be soluble in water, some ionic solids such as calcium hydroxide or silver sulfate are only sparingly soluble (soluble to a small extent) in water.

The solubility of ionic compounds depends on two factors.
- The forces of attraction between the water molecules and the ions of the solid.
- The forces of attraction between the cations and anions of the solid.

![Diagram of water molecule and ions]

Fig 1: Dissolving of ionic compound in water

The solubility of sparingly soluble ionic compounds can be estimated from its solubility product, $K_{sp}$, which is a constant value that is only affected by temperature. The higher the $K_{sp}$ value, the more soluble the compound will be.

The table below shows the $K_{sp}$ values of some common ionic compounds.

<table>
<thead>
<tr>
<th>Compound</th>
<th>Chemical Formula</th>
<th>$K_{sp}$ (mol$^2$/dm$^6$) at 25°C</th>
</tr>
</thead>
<tbody>
<tr>
<td>Barium sulfate</td>
<td>BaSO$_4$</td>
<td>$1.0 \times 10^{-5}$</td>
</tr>
<tr>
<td>Calcium carbonate</td>
<td>CaCO$_3$</td>
<td>$5.0 \times 10^{-3}$</td>
</tr>
<tr>
<td>Calcium sulfate</td>
<td>CaSO$_4$</td>
<td>$2.0 \times 10^{-5}$</td>
</tr>
<tr>
<td>Silver chloride</td>
<td>AgCl</td>
<td>$2.0 \times 10^{-10}$</td>
</tr>
</tbody>
</table>

Table 1

Predicting precipitation

The $K_{sp}$ value can be used to predict whether precipitation of a certain compound will occur when two solutions are mixed together. The ionic product of the concentration of cations and anions present in the mixed solution is compared to the $K_{sp}$ value. For instance,

$\text{BaSO}_4 \rightleftharpoons \text{Ba}^{2+} + \text{SO}_4^{2-}$

**Ionic product** = (Concentration of Ba$^{2+}$ ions in solution) x (Concentration of SO$_4^{2-}$ in solution)

<table>
<thead>
<tr>
<th>Scenario</th>
<th>Outcome</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ionic product = $K_{sp}$</td>
<td>No precipitation. Solution is just saturated.</td>
</tr>
<tr>
<td>Ionic product &lt; $K_{sp}$</td>
<td>No precipitation. Solution is not saturated.</td>
</tr>
<tr>
<td>Ionic product &gt; $K_{sp}$</td>
<td>Precipitation is observed. Solution is already saturated.</td>
</tr>
</tbody>
</table>

Table 2
a) Using information from above, explain why sodium chloride is very soluble in water while silver chloride is only sparingly soluble. [2]

b) Predict the relationship between temperature and $K_{sp}$ value of an ionic compound. [1]

c) State the least soluble compound found in table 1. [1]

d) Suggest the name of another ionic compound not present in table 1 that has a very low $K_{sp}$ value. [1]

e) Michelle plans to add equal volume of 0.01 mol/dm³ of calcium nitrate solution to 0.0025 mol/dm³ of sodium sulfate solution to precipitate out calcium sulfate salt as shown in the diagram below.

Determine, by calculation of ionic product in the mixed solution, and with reference to table 1 and 2, if precipitation of any compound will occur. [3]

f) Without further addition of any reagent, suggest two ways of increasing the amount of solid precipitated out from a saturated solution. [2]
Perspex, also known as acrylic, is a transparent thermoplastic that is made from the polymerisation of a monomer, methyl methacrylate.

The process below shows part of the production process of methyl methacrylate.

\[
\begin{align*}
\text{CH}_2=\text{C} &-\text{COOH} \\
&\xrightarrow{\text{Reagent A}} \\
\text{CH}_2=\text{C} &-\text{COOCH}_3 \\
&\text{Conc. H}_2\text{SO}_4 \\
&\text{Heat} \\
&\text{Methyl methacrylate}
\end{align*}
\]

a) Name reagent A.

b) State the type of polymerisation that methyl methacrylate undergoes and the chemical name of perspex.

c) Draw two repeating units in the polymer perspex.

d) Aqueous bromine solution is added to perspex.
   i) State the observation made.
   ii) State one conclusion, based on the observation in part di), about perspex.

e) Another type of transparent thermoplastic, polycarbonates, is used to make spectacle lens due to its high strength and ability to block UV light.

Polycarbonate is formed by condensation polymerisation where small molecules of HCl are removed as the polymerisation takes place. The two monomers of polycarbonates are shown below.

\[
\begin{align*}
\text{HO-} &\text{C}_6\text{H}_4\text{CH}_3 \\
&\text{BPA} \\
\text{CH}_3 &\text{HO}
\end{align*}
\]

\[
\begin{align*}
\text{Cl} &\text{C} \equiv \text{Cl}
\end{align*}
\]

Phosgene

Draw the structure of polycarbonate.

f) State one difference between the polymerisation process of perspex and polycarbonate other than the elimination of small molecules in polycarbonate.
EITHER

B8) The table shows the arrangement of elements made by John Newlands in 1886.

<table>
<thead>
<tr>
<th>ROW</th>

<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

a) The elements are arranged in vertical column according to their relative atomic masses. State how the elements are arranged in the modern Periodic Table.

b) Based on the arrangement, determine the first three elements in the last column. List the elements in the order from the top to the bottom.

c) With reference to the elements in the second horizontal row,

i) State which element is wrongly placed and what the new classification of that element in modern Periodic Table?

ii) Explain your answer in part ci) using the chemical reaction of the elements with water. Write a suitable chemical equation to support your answer.

d) The graph below shows the melting point of the elements in the second column of Newlands table with the exclusion of fluorine.

![Graph showing melting points of elements]

i) Explain why melting point increases from sodium to aluminium in the graph.

ii) Even though silicon, phosphorus and sulfur are all covalent substances, silicon's melting point is far apart from that of phosphorus and sulfur. Explain why this is so.
In the past 60 years, scientists have discovered that a chemical reaction between a naturally occurring chemical called luciferin, together with oxygen, calcium or magnesium, is responsible for the glowing of fireflies. The structural formula of a molecule of luciferin is shown below.

![Structural formula of Luciferin](image)

**Fig 2: Structural formula of Luciferin**

a) State the molecular formula of Luciferin.

b) Calculate the percentage by mass of sulfur in a molecule of Luciferin.

c) A series of chemical tests are performed on a sample of Luciferin.
   (i) Suggest the observations for each of the test.
   Test 1: Addition of acidified potassium dichromate (VI).
   Test 2. Addition of aqueous sodium hydrogen carbonate.

   (ii) Draw the full structural formula of the organic product formed in test 1.

   (b) It is often thought that the production of light by fireflies occurs via the following pathway catalysed by an enzyme luciferase.

   \[
   \text{Lucifenn} + \text{O}_2 \xrightarrow{\text{Luciferase}} \text{Oxylucifenn} + \text{CO}_2 + \text{Light}
   \]

   (i) State, with reasons, whether the oxidation of Lucifenn is an exothermic or endothermic reaction.

   (ii) Define what is meant by an enzyme.

   (iii) Draw a well-labelled energy profile diagram for the oxidation of Luciferin, clearly showing the pathways for the catalysed and non-catalysed reactions.

**ANSWERS**

Section A: Structured Questions [50m]
Answer all questions in this section in the spaces provided

A1

a) Isotopes are atoms of the same element with different number of neutrons but same number of protons

<table>
<thead>
<tr>
<th>Isotope</th>
<th>Number of protons</th>
<th>Number of electrons</th>
<th>Number of neutrons</th>
</tr>
</thead>
<tbody>
<tr>
<td>$^6\text{C}$</td>
<td>6</td>
<td>6</td>
<td>2</td>
</tr>
<tr>
<td>$^{12}\text{C}$</td>
<td>6</td>
<td>6</td>
<td>6</td>
</tr>
<tr>
<td>$^{14}\text{C}$</td>
<td>6</td>
<td>6</td>
<td>8</td>
</tr>
</tbody>
</table>

[2] for each isotope if all correct. [1] if at least one correct

i) Proton

ii) Chlorine atom/free radical

b) Fe$_2$O$_3$ (s) + 3 CO (g) $\rightarrow$ 2Fe (s) + 3 CO$_2$(g)

[1] for correct balanced equation

[1] for correct as (not given if equation is wrong)

c) Mass of Iron in 10 tonnes of haematite = $2\times(65) / (2336) \times 10 = 7.09$ tonne [1]

Mass of Iron extracted = 65/100 x 7.09

= 4.55 tonne (3sf) [1]

d) i) Sulfur dioxide reacts with water vapour in the air to form acid rain [1]

ii) Flue gas desulfurization [1]

$\text{SO}_2 + \text{CaCO}_3 \rightarrow \text{CaSO}_3 + \text{CO}_2$ [1]

and/or

$\text{SO}_2 + \text{CaO} \rightarrow \text{CaSO}_3$

e) i) Metals are not made up of molecules [1]

They are made up of positive metal cations surrounded by a sea of free and mobile electrons. [1]

ii) [1] for correct arrangement

[1] for balanced charges

[1] for labels
iv) High carbon steel / Manganese steel [1]

A3

Beaker X

Beaker Y

copper (II) sulfate solution

a) Beaker Y [1]

b) Draw arrows on both wires to show the flow of electrons in the circuit above. [1]

c) The following observations have been made:

<table>
<thead>
<tr>
<th>Location</th>
<th>Observations</th>
<th>[1]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electrode A</td>
<td>The electrode grows larger in size</td>
<td></td>
</tr>
<tr>
<td>Electrode B</td>
<td>The electrode grows smaller in size</td>
<td></td>
</tr>
<tr>
<td>Electrolyte in X</td>
<td>The blue solution remains unchanged, no change is observed.</td>
<td></td>
</tr>
<tr>
<td>Electrolyte in Y</td>
<td>The blue solution fades to a lighter colour.</td>
<td></td>
</tr>
</tbody>
</table>

d) Cu → Cu^{2+} + 2e\(^{-}\) [1]

e) Electrode A grows larger in size at a faster rate [1]

A4

a) Na₂SO₃ + 2HCl → 2NaCl + H₂O + SO₂ [1]

b) Test the remaining gas with a filter paper soaked in acidified KMnO₄ [1]

If purple KMnO₄ turns colourless, SO₂ is still present. If KMnO₄ remains purple, SO₂ is not present. [1]
Section B Essay Question [30m]

B7) a) Water molecules attract the Na⁺ and Cl⁻ ions much stronger than the attraction between the ions. Hence, it is very soluble in water. [1]

However, the attraction between the As⁺ and Cl⁻ ions are much stronger than the attraction between water molecules and the ions. Hence, it is only sparingly soluble. [1]

b) The higher the temperature, the higher the Ksp values or vice versa [1]

c) Barium sulfate [1]

d) Lead (II) chloride/sulfate / All carbonates except SPA. [1]

e) Ionic product = [Ca⁺²][SO₄⁻²] = (0.012)(0.00252) [1]
       = 6.25 x 10⁻⁷ mol²/dm⁶ [1]

Since ionic product is lesser than Ksp, there will be no precipitation. [1]

f) Evaporating the solvent to increase concentration of the ions present [1]
   Lower temperature to lower Ksp. [1]

B8) Perspex, also known as acrylic, is a transparent thermoplastic that is made from the polymerisation of a monomer, methyl methacrylate.

The process below shows part of the production process of methyl methacrylate

\[
\begin{align*}
\text{CH}_2\text{=C-CH}_3 & \xrightarrow{\text{Reagent A}} \text{CH}_2\text{=C-CH}_{3}^- \xrightarrow{\text{Cons. H}_2\text{O, Heat}} \text{CH}_2\text{=C-CH}_{3}^\text{+} \\
\text{CH}_3\text{COOH} & \xrightarrow{\text{Reagent A}} \text{CH}_3\text{COOH}^- \\
\end{align*}
\]

a) Methanol [1]

b) Addition polymerisation. [1]
   Poly(methyl methacrylate) [1]

c) \[
\begin{align*}
\text{[1] for correct structure} & \quad \text{[1] for 2 repeating units} \\
\text{[1] for correct structure} & \quad \text{[1] for bracket and n}
\end{align*}
\]

EITHER

B9) a) The elements are arranged according to the proton number/atomic number. [1]

b) I, Cs, Ba. [1]

c) i) Cu. It is classified as a transition metal in the modern Periodic Table. [1]
   ii) Cu does not react with cold water while the rest of the elements in the row will react vigorously with cold water. [1]

   \[
   2 \text{Li} + 2\text{H}_2\text{O} \rightarrow 2 \text{LiOH} + \text{H}_2 \quad (\text{Na}, \text{K} \text{or Rb all accepted}) [1]
   \]

d) i) The melting points increase from Na to Al as the charge of the metal cations increases from 1⁺ to 3⁺, causing the metallic bonds to be stronger, therefore requiring increasing amount of energy to overcome. [1]

ii) Even though, they are all covalent substances, Si has a very high melting point due to strong covalent bonds between the Si atoms in the giant molecular structure, hence requiring large amount of energy required to overcome them. [1]

The melting point drops sharply for P and S as they both have simple molecular structure where lesser amount of energy is required to overcome the weak van der Waals forces between the molecules. [1]

OR

B9) a) \[
\text{Ca}_2\text{H}_2\text{N}_2\text{SO}_4[1]
\]

b) % mass of S = \[\frac{2(32)}{184 + 16 + 28 + 64 + 48} \times 100 = 21.8\% \text{ (3sf)}[1]

c) i) Test 1: Added HCl turns from orange to green. [1]
   Test 2: Fluorescence is observed. [1]
(i) The oxidation of Luciferin is an **exothermic** reaction. Energy in the form of **light** is given off. [1]

(ii) An enzyme is a **biological catalyst**. [1]

(iii) ![Energy diagram](image)  

- [1] for correct shape of graph (on page)  
- [1] for correct labels of axes, reactants, and products  
- [1] for correct label of $\Delta H$ and $E_a$ and $E_f$
1) A student set up the apparatus as shown below to collect a sample of clean, dry gas X. Predict the identity of gas X and identify a suitable drying agent to be used.

- Dry sample of gas X
- Drying agent
- Mixture of anhydrous calcium chloride and calcium hydroxide

Gas X:  
A) Ammonia  
B) Ammonia  
C) Hydrogen chloride  
D) Hydrogen chloride

Drying agent:  
A) Calcium oxalate  
B) Concentrated sulfuric acid  
C) Calcium oxalate  
D) Concentrated sulfuric acid

2) Compound X is soluble in hot water, but not in cold water. While Compound Y is soluble in both hot and cold water. Compound X has a boiling point of 2970 °C, while compound Y has a boiling point of 1430 °C.

Which is the most suitable method in obtaining a pure, dry sample of Compound X crystals from a hot solution of Compound X and Y?

A) Cool the mixture, filter, rinse, and collect the residue.  
B) Cool the mixture, filter the filtrate, and evaporate the filtrate.  
C) Simple distillation of the mixture.  
D) Heat the mixture to dryness.

5) The following diagram shows three similar set-ups where a balloon is trapped inside each plastic container.

- I: Bromine gas  
- II: Nitrogen gas  
- III: Helium gas

Which of the following shows the correct description of the balloon in each set-up after a short while?

A) Volatilizes   
B) Grows bigger   
C) Remains the same   
D) Volatilizes

- I: Remains the same   
- II: Grows bigger   
- III: Volatilizes
8) Some isotopes are unstable and decompose naturally. In one type of decomposition, a neutron in the nucleus decomposes to form a proton, which is retained in the nucleus, and an electron, which is expelled from the nucleus. Which change describes this type of decomposition?

A) $^1\text{H} \rightarrow ^1\text{H}^+$
B) $^2\text{H}_2 \rightarrow ^2\text{H}_2^+$
C) $^3\text{Kr} \rightarrow ^3\text{Kr}^+$
D) $^4\text{He} \rightarrow ^4\text{He}^+$

9) Which of the following shows the structure of bronze?

A)

B)

C)

D)

10) Silicon carbide is a shiny, hard, chemically inert material with a very high melting point. It can be used to sharpen knives and make crucibles. Which type of structure explains these properties?

A) a giant structure with covalent bonds between carbon and silicon atoms
B) a giant structure containing metallic bonds
C) a giant structure with covalent bonds between atoms and van der Waals' forces between the layers of atoms
D) a simple molecular structure with covalent bonds between the carbon and silicon atoms

13) All of the following substances produce carbon dioxide upon complete combustion. Which one will produce 240 dm$^3$ of carbon dioxide gas when cooled to room temperature?

A) 11.5 g of ethanol ($Mr = 46$)
B) 15.0 g of ethane ($Mr = 30$)
C) 44.0 g of propane ($Mr = 44$)
D) 18.0 g of graphite ($Ar = 12$)

14) When 250 cm$^3$ of 3.0 mol/dm$^3$ dilute hydrochloric acid is added to 350 cm$^3$ of 2.00 mol/dm$^3$ dilute hydrochloric acid, what is the concentration of the resulting solution?

A) 1.45 mol/dm$^3$
B) 2.42 mol/dm$^3$
C) 2.50 mol/dm$^3$
D) 3.35 mol/dm$^3$

15) The diagram below shows the electrolysis of concentrated iron (II) chloride solution using a graphite cathode and a silver anode.

Which of the following statements about the electrolysis setup shown above are correct?

I. A white precipitate was formed around the anode.
II. Red litmus paper is bleached when it was dipped into the electrolyte beside the anode after some time.
III. A gas was formed at both electrodes.
IV. A dirty green precipitate may be formed after some time.

A) I and II only
B) I and IV only
C) II and III only
D) III and IV only
19) The scheme below shows how ethanol is utilized as a fuel:

\[ C_2H_5OH (l) \xrightarrow{\text{I}} C_2H_4 (g) \xrightarrow{\text{II}} C_2H_2 (g) \xrightarrow{\text{III}} 2CO_2 (g) + 3H_2O (g) \rightarrow 6CO_2 (g) + 7H_2O (l) \]

Which stages are exothermic?

A) I and II
B) II and III
C) III and IV
D) I and IV

20) The graph below shows how the total volume of hydrogen produced by the reaction between dilute nitric acid and an excess of calcium, varies with time.

![Graph showing volume of hydrogen produced over time]

Which of the following statements about section PQ of the curve is correct?

A) The reaction is continuing at a constant rate
B) The rate of production of hydrogen is at a maximum
C) All the calcium has reacted.
D) All dilute nitric acid has reacted.

24) Which statements about the reaction between 26.0 cm³ of 0.1 mol dm⁻³ hydrochloric acid and 50.0 cm³ of 0.5 mol dm⁻³ sodium hydroxide are true?

I. The ionic equation of reaction is: \( H^+(aq) + OH^-(aq) \rightarrow H_2O(l) \)
II. The temperature of the solution increases as hydrochloric acid is added.
III. There is no change in the total mass of the reactants and products.
IV. Pure dry sodium chloride crystals can be obtained by heating the mixture to dryness.

A) I only
B) II and III only
C) I, II and IV only
D) II, III and IV

25) What will be observed when a beaker of phenolphthalein solution dissolved in pure butanol is mixed with magnesium metal?

A) The mass of the set-up decreases slowly with effervescence observed. The magnesium metal becomes smaller.
B) The mass of the set-up decreases rapidly with effervescence observed. The magnesium metal disappears.
C) The mass of the set-up increases slowly with white precipitate observed.
D) The mass of the set-up remains the same with no visible reaction.

26) Which of the following mixtures below will result in the ionic equation shown?

\[ Pu^{2+} + \ SO_4^{2-} \rightarrow PbSO_4 \]

A) aqueous lead(II) nitrate is added to dilute sulfuric acid
B) lead(II) chloride is added to aqueous sodium sulfate
C) lead(II) nitrate is added to dilute sulfuric acid
D) lead(II) sulfate is added to water
29) A part of the Periodic Table is shown below

<table>
<thead>
<tr>
<th>Period</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>S</td>
<td>R</td>
<td>T</td>
<td>U</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Which of the following statements is correct?

A) The valence shell of an atom of R has an octet structure
B) The metallic character of the Period 2 elements increases from S to U
C) T forms an ionic compound with U
D) U is a stronger oxidizing agent than V.

30) A metal is between magnesium and aluminium in the reactivity series. How can the metal be extracted?

A) Reduction of its oxide using carbon.
B) Electrolysis of its salt solution
C) Reduction of its oxide using aluminium.
D) Electrolysis of its molten compound

31) Which of the following reactions takes place in the blast furnace for the extraction of iron from haematite?

A) \(3\text{Fe}_2\text{O}_3 + 4\text{H}_2\text{O} \rightarrow 2\text{Fe}_3\text{O}_4 + 4\text{H}_2\)
B) \(\text{SiO}_2 + \text{CaO} \rightarrow \text{CaSiO}_3\)
C) \(2\text{CO} + \text{Fe}_2\text{O}_3 \rightarrow 2\text{Fe} + \text{SiO}_2 + 2\text{CO}_2\)
D) \(2\text{Fe}_2\text{O}_3 + 3\text{O} \rightarrow 4\text{Fe} + 3\text{CO}_2\)

34) A 240 cm\(^2\) sample of clean, dry air is passed over hot excess copper at room temperature and pressure until there is no further change in volume. The pink copper metal turns black.

What is the mass of the black solid formed when the reaction is complete?

A) 0.16 g
B) 0.32 g
C) 0.80 g
D) 1.60 g

35) The diagram below shows a simplified process of desulphurisation.

Which of the observation at outlet X best describes the nature of the gases escaping?

A) The gases turned moist litmus paper blue
B) The gases turned oxidised potassium manganate(VII) purple.
C) The gases turned oxidised potassium iodide brown
D) The gases formed a white precipitate in limewater.
36) The reaction between a hydrocarbon $\text{C}_6\text{H}_{14}$ and chlorine can be represented as follows

$$\text{C}_6\text{H}_{14} (g) + 2\text{Cl}_2 (g) \rightarrow \text{C}_6\text{H}_2\text{Cl}_6 (g) + 2\text{HCl} (g)$$

Which of the following is a correct statement?

A) It is an addition reaction
B) The molecular formula of the hydrocarbon is $\text{C}_6\text{H}_{14}$
C) Ultraviolet light is an essential condition for the reaction to take place
D) High temperature, high pressure and a catalyst are required in the reaction

40) When two different types of monomers are joined in the same polymer chain, a copolymer can be formed. Part of a copolymer is shown below

```
CH₃ CH₂ H     CH₄ CH₃ CH₂ H CH₃ CH₂
\________________________\________
H H H H H H H H H H H H H H H H H
```

What are the two monomers used to produce the copolymer?

A) pent-2-ene and but-1-ene
B) pent-2-ene and but-2-ene
C) propene and but-1-ene
D) propene and but-2-ene

~ End of Paper ~
Section A

Answer all the questions in this section in the spaces provided.

The total mark for this section is 50.

A1 The following table shows the properties of pure substances Q to T.

<table>
<thead>
<tr>
<th>Substance</th>
<th>Melting point / °C</th>
<th>Boiling point / °C</th>
<th>Solubility in water</th>
</tr>
</thead>
<tbody>
<tr>
<td>Q</td>
<td>-114</td>
<td>78</td>
<td>Very soluble</td>
</tr>
<tr>
<td>R</td>
<td>801</td>
<td>1413</td>
<td>Very soluble</td>
</tr>
<tr>
<td>S</td>
<td>-74</td>
<td>99</td>
<td>Insoluble</td>
</tr>
<tr>
<td>T</td>
<td>Changes from solid to gas at 114°C</td>
<td>99</td>
<td>Slightly soluble</td>
</tr>
</tbody>
</table>

(a) Name the most suitable method that can be used to obtain

(i) water from an aqueous solution of R. [1]

(ii) S from a mixture of water and S. [1]

(iii) solid T from a mixture of solid R and solid T. [1]
(b) 100 cm$^3$ of a mixture containing 60% by volume of water and 40% by volume of Q is separated by fractional distillation. The graph below shows the temperature change during the process of separation.

In the axes below, sketch a graph to show how the total volume of distillate collected changes over time. Indicate clearly the volume of water and Q that could be obtained.

[Total: 5 marks]
The reaction between substances A and B produces substances C and D according to the following equation.

\[ A \text{ (g)} + 2B \text{ (g)} \rightarrow C \text{ (g)} + 3D \text{ (g)} \quad \Delta H = +x \text{ kJ/mol} \]

Some A and B are placed in a closed container and allowed to react at a fixed temperature.

The following graph shows how the volumes of A and C change as the reaction progresses.

(a) (i) On the graph above, sketch a line to show how the volume of C changes as the reaction progresses if a catalyst was added. Label this line "(a1)".

(ii) Explain, in terms of collision of particles, your answer in part (ai).

(iii) State what happens to the value of the enthalpy change of the reaction if a catalyst was added.

(iv) On the graph above, sketch a line to show how the volume of D changes as the reaction progresses. Label this line "(aiv)".
(b) (i) Explain, in terms of bond breaking and bond forming, why the enthalpy change for the above reaction is positive.

(ii) In the space below, sketch a fully labelled energy profile diagram for the above reaction.

[Total: 11 marks]
A car manufacturer wants to fit the most environmentally friendly engine into their new car model. They considered two different types of engines, one normal and one known as a "lean burn" engine which has a lower working temperature. They also made modifications to both types of engines, thus coming up with four different types of engines and tested all four of them out. The table below shows the percentage composition of exhaust gases emitted from cars fitted with the four different engines.

<table>
<thead>
<tr>
<th></th>
<th>Normal engine</th>
<th>Normal engine with &quot;modification&quot;</th>
<th>&quot;Lean burn&quot; engine</th>
<th>&quot;Lean burn&quot; engine with &quot;modification&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>Carbon dioxide</td>
<td>14</td>
<td>15</td>
<td>16</td>
<td>18</td>

<td>0.2</td>
<td>0.03</td>
</tr>
<tr>
<td>Nitrogen oxides</td>
<td>0.3</td>
<td>0.04</td>
<td>0.05</td>
<td>0.01</td>
</tr>
<tr>
<td>Hydrocarbons</td>
<td>0.12</td>
<td>0.03</td>
<td>0.09</td>
<td>0.01</td>
</tr>
</tbody>
</table>

(a) Name the major component of the exhaust gases that is not listed in the table above.

(b) Using the data given, suggest what "modification" has been made to both the normal and "lean burn" engines.

(c) Suggest why there is a drop in the percentages of nitrogen oxides from the normal engine to the "lean burn" engine.

(d) Explain why carbon monoxide is produced in the car engines.
(e) Write the balanced chemical equation of a reaction that takes place in the engine  [1] with “modification” that leads to a lower emission of both carbon monoxide and nitrogen oxides.

(f) Nitrogen monoxide can easily be oxidised to nitrogen dioxide. State an effect on [2] the environment if nitrogen dioxide is allowed to escape into the atmosphere.

A4 Ozone is usually made by passing oxygen gas through a tube between two highly charged electrical plates.

\[ 3O_2 (g) \rightarrow 2O_3 (g) \]

The reaction is stopped before it can go to completion, so a mixture of the two gases results.

The concentration of O$_3$ in the mixture can be determined by its reaction with aqueous KI.

\[ O_3 + 2KI + H_2O \rightarrow I_2 + O_2 + 2KOH \]

The iodine formed can be estimated by its reaction with sodium thiosulfate.

\[ 2Na_2S_2O_3 + I_2 \rightarrow Na_2S_4O_6 + 2NaI \]

When 192 cm$^3$ of a mixture of oxygen and ozone gas at r.t.p was passed into an excess of aqueous KI, iodine was formed. The iodine formed was titrated with 80 cm$^3$ of 0.1 mol/dm$^3$ Na$_2$S$_2$O$_3$.

(a) (i) Calculate the number of moles of iodine produced from the reaction with [2] aqueous potassium iodide.
(a) Calculate the volume of ozone present in the 192 cm$^3$ mixture [1]

(b) Using the oxidation state of sulfur, explain whether sodium thiosulfate is reduced or oxidised.

[Total: 6 marks]
A5 This question is about the condensation reactions of some organic substances

(a) (i) Substance A contains 40.7% by mass of carbon, 5.1% by mass of hydrogen and 54.2% by mass of oxygen. Find the empirical formula of substance A.

(ii) When completely combusted, 1 mole of substance A forms 4 moles of carbon dioxide. From this information and your answer in part (a(i)), find the molecular formula of substance A.
(iii) 1 mole of substance A reacts completely with 1 mole of sodium carbonate to produce carbon dioxide gas. Substance A also reacts with N,N'-dimethylmethanediame to form a condensation polymer.

\[ \text{N,N'}-\text{dimethylmethanediame} \]

From this information and your answer in part (iii), draw the full structural formula of substance A.

Draw 1 repeating unit of the condensation polymer formed between substance A and N,N'-dimethylmethanediame.
(b) Acid anhydrides can also react with amines to form amides. The reaction between an acid anhydride and an amine gives all the 4 products as shown below.

\[
\begin{align*}
\text{acid anhydride} & \quad \text{amine} \\
\text{H-C-O-C-C-H} + \text{H-N-C-H} & \rightarrow \text{O-H} \quad \text{H-C-N-C-C-H} + \text{H-O-C-C-H}
\end{align*}
\]

AND

\[
\begin{align*}
\text{acid anhydride} & \quad \text{amine} \\
\text{H-C-O-C-C-H} + \text{H-N-C-H} & \rightarrow \text{H-C-O-H} \quad \text{H-C-N-C-C-H}
\end{align*}
\]

Draw the full structural formula of all the possible products for the reaction below.

\[
\begin{align*}
\text{H-C-O-C-C-H} + \text{H-N-C-H} & \rightarrow \text{products}
\end{align*}
\]

(c) Lastly, acid chlorides can also react with amines to form amides via condensation reactions. An example of an acid chloride reaction with an amine is shown below.

\[
\begin{align*}
\text{H-C-C-Cl} + \text{H-N-C-H} & \rightarrow \text{H-C-C-N-C-H} + \text{HCl}
\end{align*}
\]

The products are dissolved in dichloromethane, an organic solvent. A student decided to add dry blue litmus paper to the mixture obtained. Predict the observation that the student should see and explain your answer.

[Total: 9 marks]
A student wants to conduct tests to identify some unknown samples but some chemicals are missing from the laboratory.

(a) The student has three samples containing calcium, zinc and lead(II) ions. However, she does not have any alkalis to test for the ions. Describe how the student can differentiate between the three samples, including any observations that she is expected to see.

(b) The student decides to address the lack of alkalis in the laboratory by synthesising calcium oxide in two steps, which can subsequently be added to water to form calcium hydroxide. In the first step, describe how the student can synthesise a pure dry sample of calcium carbonate starting from sodium carbonate and calcium chloride.

(i) In the second step, describe how the student can obtain a pure sample of calcium oxide from the calcium carbonate obtained in part (bii).

(iv) After forming the calcium oxide in part (bii), the student added water to form [1] calcium hydroxide. Since potassium manganate(VII) is also missing from the laboratory, the student decided to use calcium hydroxide to test for sulfur dioxide. Write the chemical equation for this reaction.

(v) State the type of reaction that is occurring in part (biv). [1]

[Total: 12 marks]
B7 A phase diagram is a graphical representation of the physical states of a substance under different temperatures and pressures. The curves represent the temperature and pressure at which 2 states of the substance can coexist. As we cross the curves on the phase diagram, a change in state occurs. The triple point represents the temperature and pressure at which all 3 states of the substance coexist. The phase diagram of carbon dioxide is shown below.

(a) (i) Estimate the temperature at which liquid carbon dioxide changes to a gas at a pressure of 40 atm.

(ii) Estimate the melting point of solid carbon dioxide on a planet X where the pressure is 80 atm.
(iii) Describe how the arrangement and movement of the carbon dioxide molecules change as its pressure increases from 1 atm to 20 atm at -60°C.

(iv) Cansisters of carbon dioxide are to be stored and transported in the liquid state at 20°C. Estimate the minimum pressure it has to be stored at.

(b) Carbon is an element found in Group IV of the Periodic Table, and can exist in different forms such as graphite or diamond. Other forms of carbon include C₆₀, C₇₀ and the carbon nanotube. The structures and melting points of these three other forms of carbon are shown below.

<table>
<thead>
<tr>
<th>Structure</th>

</tbody>
</table>
(i) Based on the information given on the previous page, predict the type of structure that C_{60} has. Explain your answer in terms of bonding and structure.

(ii) Will C_{70} have a higher, lower or the same melting point as C_{60}? Explain your answer in terms of bonding and structure.

(iii) State and explain, in terms of bonding and structure, the electrical conductivity of the carbon nanotube.

[Total: 12 marks]
B8 A mixture of molten sodium bromide and sodium iodide is electrolysed.

(a) (i) Describe what you will expect to see at the anode initially and after the electrolysis is carried out for a long time. [2]

(ii) Explain your answer in part (ai). [2]

(b) Write a half ionic equation, with state symbols, for the reaction occurring at the cathode. [2]

(c) Describe the observations that you expect if the metal formed from the electrolysis is added to water. [2]

[Total: 8 marks]
Ethene is a useful molecule that can be used to synthesise many other compounds in the chemical industry.

(a) State the reaction by which ethene can be formed from a long-chain hydrocarbon [1]

(b) Propyl ethanoate is a molecule that can be formed from ethene. Describe the formation of propyl ethanoate from ethene, stating the reactants and conditions as well as the products formed in each step. You may show your answer in the form of a diagram.
(c) Ethene can also be polymerised to form poly(ethylene). Describe how ethene can be distinguished from poly(ethylene).

(d) "Poly(propene) will always have a higher melting point than poly(ethylene) as the relative molecular mass of the monomer in poly(propene) is larger." Do you agree with the above statement? Explain your answer.

[Total: 10 marks]
A student wants to find out mass of zinc in an alloy of zinc and silver. The set-up is shown below.

(a) (i) Write half ionic equations for the reactions occurring at the anode and cathode.  

(ii) The experiment is carried out until the current in the circuit stops. If the mass of the pure silver electrode increases by 0.10 g when the current stops, calculate the mass of zinc in the alloy.

(iii) Explain clearly why the mass of zinc calculated is lower than expected.
(b) Suggest another method, other than the setup shown in part (a) above, the student could use to find out the mass of zinc in the alloy. Name the reagent(s) used, state all important steps that should be taken, and write balanced equations for any chemical reactions that take place.

Empirical formula: C₂H₄O₂

(ii) Since 1 mole of substance A forms 4 moles of CO₂,
1 mole of substance A has 4 moles of C
Therefore molecular formula is C₂H₄O₄

(iii) Substance A:

Repeating unit:

```
       O
      /   |
     H     H
```

b. H₂O H₂O H₂O
H=C-N-C=H + H–C–C–O–H

H H H

There is no observable change/blue litmus paper remain blue
Since water is not present
Hydrogen chloride does not dissociate/ionise to form Hydrogen ions

a. Add aqeous sodium chloride/any soluble chlorides
or soluble iodide
White precipitate or bright yellow precipitate if lead(II) ions are present
Add aqeous sodium sulfate/any soluble sulfates to remaining 2 solutions
White precipitate formed if calcium ions are present

b. i. Mix aqeous sodium carbonate and aqeous calcium chloride
White precipitate formed
Filter mixture and retain residue
Wash residue with distilled water
Dry residue with filter paper

ii. Heat calcium carbonate until there is no further decrease in mass

ii. Sodium will form a very stable carbonate
That cannot be thermally decomposed

What is the value of p in terms of x, y and z?

A. \( x + y - z \)
B. \( y + z - x \)
C. \( x - y \)
D. \( x + y - z \)

2. Samples of Chye Sim and Kaifan vegetables were tested to determine if the poisonous Insecticides A, B and C were present in them. The diagram below shows the results of the tests:

Which of the following statements is true based on the chromatogram above?

A. Only Chye Sim contains at least one of the insecticides, A, B and C.
B. Only Kaifan contains at least one of the insecticides, A, B and C.
C. Both Chye Sim and Kaifan contain at least one of the insecticides, A, B and C.
D. Both Chye Sim and Kaifan do not contain any of the insecticides, A, B and C.
3 The following apparatus was used to separate 2 miscible liquids S (boiling point 60°C) and T (boiling point 90°C).

What is the graph obtained when the volume of distillate is plotted against temperature?

A |
---|
| Volume of distillate (cm³) |
| Temperature (°C) |

B |
---|
| Volume of distillate (cm³) |
| Temperature (°C) |

C |
---|
| Volume of distillate (cm³) |

D |
---|
| Volume of distillate (cm³) |
| Temperature (°C) |

4 Study the following statements in a student's notebook:

I. In a solid, the particles are stationary and held in fixed positions due to strong forces of attraction.
II. When a solid is heated, the particles expand and become larger.
III. At the melting point, the particles are able to slide over one another.
IV. When the boiling point is reached, evaporation and boiling start to take place and the gas is formed.

Which of the above statement(s) is(are) true?

A. III only
B. I and II only
C. I, II and III only
D. I, II, III and IV

5 In gold jewellery, the metal gold is usually mixed with copper and silver. Which of the following changes in physical properties does not happen when the alloy is formed?

A. Density decreases
B. Hardness increases
C. Colour changes
D. Malleability increases

6 A major component of bricks is a compound consisting of elements K and L chemically combined together.

What are elements K and L?

<table>

10 The percentage composition by mass of a compound containing carbon, fluorine, and chlorine is as follows:

Carbon 18.09%  
Fluorine 28.50%  
Chlorine 53.45%

Which of the following could be the molecular formula of this compound?

A CF₂Cl  
B CF₂Cl₂  
C CF₂Cl₃  
D CF₂Cl₄

11 Which one of the samples contains the most atoms?

A 5.0 mol of CO₂  
B 0.5 mol of C₂H₆  
C 3.0 mol of H₂  
D 1.0 mol of SO₂

12 A sample of 2.00 g fertilizer was analysed for its sulphate content. After a series of procedures, 2.33 grams of barium sulphate were precipitated from the fertilizer. What is the percentage composition by mass of sulphate in the fertilizer?

A 38.4%  
B 41.2%  
C 81.6%  
D 93.2%

13 Three electrochemical cells are set up using copper metal and three unknown metals, U, V and W as electrodes, immersed in dilute sulphuric acid of the same concentration. The voltage produced in each cell is given in the table below:

<table>
<thead>
<tr>
<th>Cell</th>
<th>Metals used</th>
<th>Voltage</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Copper and U</td>
<td>0.45</td>

<tr>
<td>2</td>
<td>Copper and V</td>
<td>1.11</td>
</tr>
<tr>
<td>3</td>
<td>Copper and W</td>
<td>2.71</td>
</tr>
</tbody>
</table>

Which of the following correctly lists the metals U, V and W in the order of increasing ease of oxidation?

A U, V, Copper, W  
B W, V, Copper, U  
C Copper, U, V, W  
D Copper, W, V, U
14 What happens to the positive ions at the cathode during electrolysis?
A Nothing happens to the ions
B The ions lose electrons to form positive ions
C The ions lose electrons to form neutral atoms
D The ions gain electrons to form neutral atoms

15 Concentrated aqueous potassium chloride is electrolysed using carbon electrodes. What happens to the electrolyte?
A It becomes more acidic.
B It becomes more alkaline.
C It becomes more dilute.
D It becomes more concentrated.

16 Which of the following correctly describes what takes place in a hydrogen-oxygen fuel cell?
A Hydrogen ions are reduced at the positive electrode to form hydrogen.
B Hydrogen ions are oxidised at the positive electrode to form hydrogen.
C Hydrogen gas is reduced at the negative electrode to form water.
D Hydrogen gas is oxidised at the negative electrode to form water.

17 Which of the following statements is true for an endothermic reaction?
A Energy is absorbed from the surroundings and temperature increases.
B Energy is released to the surroundings and temperature decreases.
C Energy is absorbed from the surroundings and temperature decreases.
D Energy is released to the surroundings and temperature increases.

18 The equation for the reaction between magnesium and hydrochloric acid is given below:
Mg(s) + 2HCl(aq) → MgCl₂(aq) + H₂(g) \( \Delta H = \text{negative} \)
Which statement about this reaction is incorrect?
A The products possess less energy than the reactants.
B The bonds of the reactants are stronger than the bonds of the products.
C The total energy change in bond formation is more than that in bond breaking.
D The magnesium has been oxidised.

19 Which of the following graphs represents how the rate of reaction varies with time when an excess of zinc reacts with dilute hydrochloric acid?
A
B
C
D

20 Which of the following is the strongest reducing agent?
A chlorine gas
B chloride ion
C bromine gas
D bromide ion

21 In which reaction is the underlined substance not reduced?
A KBrO₃ + 5KBr + 6HNO₃ → 6KNO₃ + 3Br₂ + 3H₂O
B 5CH₂OH + 4MnO₄⁻ → 5H₃COOH + 4MnO₂
C Ag₂CO₃ + 2NaOH → Ag₂O + Na₂CO₃ + H₂O
D PbO₂ + 4HCl → PbCl₂ + Cl₂ + 2H₂O

22 A sample of air polluted with sulfur dioxide was passed through aqueous potassium iodide and diluted aqueous potassium permanganate. Which pair of colour changes are both correct?

<table>
<thead>
<tr>
<th>Aqueous potassium iodide</th>
<th>Activated aqueous potassium permanganate</th>

</tbody>
</table>
23 What is the ionic equation for the reaction that occurs when propanoic acid, $\text{C}_3\text{H}_6\text{COOH}$, and potassium hydroxide solutions are mixed?

A  $\text{H}^+ + \text{OH}^- \rightarrow \text{H}_2\text{O}$
B  $\text{H}^+ + \text{KOH} \rightarrow \text{K}^+ + \text{H}_2\text{O}$
C  $\text{C}_3\text{H}_6\text{COOH} + \text{KOH} \rightarrow \text{C}_3\text{H}_5\text{COOK} + \text{H}_2\text{O}$
D  $\text{C}_3\text{H}_6\text{COO}^- + \text{K}^+ \rightarrow \text{C}_3\text{H}_5\text{COOK}$

24 Which of the following are uses of sulfuric acid?

I  Making fertilizers
II  Sterilising water
III  Making detergents
IV  Used in car batteries

A  I and II only
B  II and III only
C  I, III and IV only
D  I, II, III and IV

25 The sulphate of element F is green. Which other properties is element F likely to have?

<table>
<thead>
<tr>
<th>density</th>

26 The positions of four elements in the Periodic Table are shown. Which element is most likely to form an amphoteric oxide?

A

27 Which statements explain why aluminium is preferred to iron for making drink cans?

I  Aluminium is lighter than iron
II  Aluminium corrodes less easily than iron
III  Aluminium is a better conductor of heat than iron

A  I and II only
B  I and III only
C  II and III only
D  I, II and III only

28 Which of the following explains why recycling ensures that metals will be available in the future?

A  Dumping of metals in landfill sites is unsightly
B  Recycling avoids the environmental damage caused by mining for metals
C  Recycling costs less than obtaining metals from their ores
D  There are only limited amounts of metals in the Earth's surface

29 Which reaction produces most of the carbon monoxide used to extract iron in the blast furnace?

A  Burning coke in air
B  Reacting coke with carbon dioxide
C  Reacting iron(III) oxides with coke
D  Decomposition of limestone

30 Metal U displaces metal V from an aqueous solution of the restate of V. Metal W reacts with cold water to give hydrogen, but metal U gives hydrogen only when reacted with steam. Metal U can be extracted from its oxide by reaction with carbon but not with hydrogen.

What could elements U, V and W be?

<table>

33. Which of the following is NOT a problem associated with plastics?
A. Burning plastics gives off toxic gases
B. Disposal of plastics by burning can cause shortage of landfill sites
C. Plastics made from plants are biodegradable.
D. Manufacture of plastics leads to exhaustion of non-renewable energy resources

34. What process/reaction is occurring when ethene and acetone are obtained from decane, C_{10}H_{22}?
A. Cracking
B. Polymerization
C. Fractional Distillation
D. Combustion

35. Nonane is an alkane present in petrol. What are the products formed when nonane is completely burnt in air?
A. Carbon dioxide and hydrogen
B. Carbon monoxide and water
C. Carbon dioxide and water
D. Carbon dioxide, carbon monoxide and water

36. Which of the following compounds can turn orange acidified potassium dichromate(VI) green?
A. CH₃CH₂
B. CH₃CH₂OH
C. CH₃COOH
D. CH₃COOCH₃

37. One possible structure of C₄H₇Br₂ is

Which of the following are isomers of this organic compound?

I  II  III  IV

V

A. I and V only
B. II and III only
C. III, IV and V only
D. I, IV and V only
38 What is the molecular formula of the ester formed when propanol is reacted with butanoic acid?
A \( \text{C}_9\text{H}_{19}\text{O}_2\text{C}_2\text{H}_5 \)
B \( \text{C}_9\text{H}_{15}\text{O}_2\text{C}_2\text{H}_5 \)
C \( \text{C}_9\text{H}_{13}\text{O}_2\text{C}_2\text{H}_5 \)
D \( \text{C}_9\text{H}_{17}\text{O}_2\text{C}_2\text{H}_5 \)

39 A polymer has the following structure

\[
\begin{array}{c}
\text{H} \\
\text{C} \\
\text{CH}_3 \\
\text{H} \\
\text{C} \\
\text{CH}_3 \\
\text{H} \\
\text{CH}_2 \text{H}_2 \\
\text{C} \\
\text{CH}_3 \\
\end{array}
\]

Its monomer is
A propanoic acid
B butanoic acid
C propanol
D butanol

40 The diagram shows a repeat unit of a polymer. Which of the following statements about the polymer and the monomers it is made from is/are true?

\[
\begin{array}{c}
\text{C} \\
\text{H}_2 \text{N} \\
\text{N} \\
\text{C} \\
\text{H}_2 \text{N} \\
\end{array}
\]

I. The polymer is made from the joining of many unsaturated monomers
II. One of its monomers can react with sodium hydroxide
III. The polymer is a polyester
IV. If the total mass of the monomers reacted together to form the polymer is 10000g, the maximum mass of polymer formed will also be 10000g

A II only
B I and III only
C II and IV only
D II, III and IV only
Chemistry 5073/02

Paper 2 Theory

Tuesday 28 July 2015 1 hour 45 minutes

Candidates answer on the Question Paper.
No Additional materials are required.
READ THESE INSTRUCTIONS FIRST

Write your class, index number and name on all the work you hand in.
Write in dark blue or black pen.
You may use a soft pencil for any diagrams or graphs.
Do not use staples, paper clips, highlighters, glue or correction fluid/tape.

Section A
Answer all questions in the spaces provided.

Section B
Answer all questions, the last question is in the form either/or.
Answer all questions in the spaces provided.

At the end of the examination, fasten all your work securely together.
The number of marks is given in brackets [ ] at the end of each question or part question.
A copy of the Periodic Table is printed on page 22

The use of an approved scientific calculator is expected, where appropriate.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

(b) Study the 6 statements below. Put a tick (√) in the box if the statement is true.

- Air is a mixture.
- All gases in air are elements.
- The components in air are only made up of non-metals.
- There are weak attractions between the molecules in air.
- The gases in air have high melting and boiling points.
- Liquid air does not have a fixed boiling point.

[2]

[Total: 4]
A2. The diagram below shows the main parts of an electric motor.

Graphite contacts are used to conduct electricity to the copper ring. When electricity passes through the wires, the copper ring rotates rapidly, turning the motor which is connected to the drill bit. The ring does not get stuck or become worn out.

(a) Explain, in terms of structure and bonding, why copper and graphite are able to conduct electricity.

(i) copper

(ii) graphite

(b) Explain why the copper ring does not become worn out easily though it is in constant contact with the graphite during rotation.

[Total: 6]
A student carries out some tests on an unknown solution P which is known to contain 2 metallic cations and 1 anion. She recorded her observations and deductions in the table shown below.

<table>
<thead>
<tr>
<th>Expt No.</th>
<th>Procedure</th>
<th>Observations</th>

(b) Describe a simple test to differentiate between aluminium ions (Al^{3+}) and lead(II) ions (Pb^{2+}).

[Total: 5]
The rate of reaction between hydrochloric acid and excess marble chips (calcium carbonate) was investigated at a temperature of 40°C using the apparatus shown in the diagram below.

The mass of the flask and contents was measured every half minute for ten minutes. The data obtained was plotted on a graph shown in the grid below.

(a) Complete the graph by drawing a line of best fit.

(b) Explain why the mass of the flask and contents decreased with time.
(c) State the time taken for the reaction to complete.

(d) A student repeated the experiment but forgot to place the cotton wool at the neck of the conical flask. State how his results would be different and explain your answer.

(e) Given that 40 cm$^3$ of hydrochloric acid were used in the reaction, calculate the concentration of this acid in mol/dm$^3$.

Another student repeated the first experiment at a temperature of 50°C. All other variables were kept the same.

(f) On the same grid on page 5, draw the graph she can expect to obtain for this experiment. Label this graph T.

(g) Explain, in terms of the collision theory, how an increase in temperature affects the rate of reaction.
A5 One method of manufacturing hydrogen is to pass methane and steam over heated nickel catalyst, a process called steam reforming.

\[ \text{CH}_4 (g) + \text{H}_2\text{O} (g) \rightarrow \text{CO} (g) + 3\text{H}_2 (g) \]

(a) Using the bond energies listed in the table below, calculate the enthalpy change (\(\Delta\text{H}\)) of this reaction.

<table>
<thead>
<tr>

(b) Using your answer to part (a), draw the energy profile diagram using the axes given below, showing the activation energy and the enthalpy change clearly.
(c) State whether this is an endothermic or exothermic reaction. Explain your answer in terms of bond breaking and bond forming.

[2]

[Total: 8]
A6 The diagram below shows a food label describing the nutritional content of a packet of crackers.

![Nutrition Facts]

From the food label, it can be seen that the cracker contains both saturated and unsaturated fat.

(a) Describe a simple chemical test to differentiate between saturated fat and unsaturated fat.

(b) Describe the main difference in structure between monounsaturated fat and polyunsaturated fat.

Saturated fats are linked to heart problems. In order to be able to claim that their crackers are healthy, the manufacturer decides to use a vegetable oil which has a higher unsaturated fat content. In a test to determine what kind of vegetable oil is healthier, a laboratory investigation was carried out.

20 cm³ of different vegetable oils were titrated with bromine solution of concentration 0.50 mol/dm³. The results are shown in the table on page 10.
(c) Complete the table above.

<table>
<thead>
<tr>
<th>Vegetable oil</th>
<th>Initial burette reading (cm³)</th>
<th>Final burette reading (cm³)</th>
<th>Volume of bromine solution used (cm³)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Palm</td>

A7 The diagram below shows the structure of an ester molecule M.

\[
\begin{align*}
&\text{H}_2\text{C} = \text{C} \quad \text{CH}_3 \\
&\text{O} \quad \text{C} = \text{O} \\
&\text{O} \quad \text{CH}_3 \\
\end{align*}
\]

(a) Circle clearly on the above diagram the group of atoms which makes this molecule an ester.

When M is reacted with water under reflux in the presence of a catalyst, an alcohol and a carboxylic acid are formed.

(b) Draw the structures of the 2 products formed.

Product 1

Product 2

When M undergoes polymerization, a polymer called Perspex is formed.

(c) What type of polymer is Perspex? Give a reason for your answer.

Section B

Answer all three questions in this section.

The last question is in the form of an either/or and only one of the alternatives should be attempted.

B8 The Haber process, also called the Haber–Bosch process, is an artificial nitrogen fixation process and is the main industrial procedure for the production of ammonia today. It converts atmospheric nitrogen to ammonia by reacting it with hydrogen. Named after its inventors, German chemists Fritz Haber and Carl Bosch, who developed it in the first half of the twentieth century, the Haber process provided Germany with a source of ammonia for the production of explosives during World War I. Today, the ammonia is mainly used to produce fertilisers.

The diagram below shows how a modern ammonia manufacturing plant looks like.

Nitrogen and hydrogen

The yield of ammonia can vary, depending on the temperature and pressure. The table below shows the percentage yield under different conditions.

<table>
<thead>
<tr>

(a) Write the equation (including state symbols) for the reaction between nitrogen and hydrogen in the Haber Process.

\[ \text{N}_2 + 3\text{H}_2 \rightarrow 2\text{NH}_3 \]  

[1]

(b) State the main source of nitrogen and the process by which it is obtained.

[1]

(c) Suggest why air is not used in the Haber process although 78% of air is nitrogen.

[1]

(d) The reactant gases are passed through a substance in the reactor. Name this substance and state its function.

Substance: .......  
Function: .......  
[1]

(e) From the information in the table, describe how temperature and pressure affects the yield of ammonia

[2]

(f) A particular ammonia plant uses a temperature of 400°C and pressure of 200 atm. Using the information in the table, calculate the mass of ammonia formed when 210 tonnes of nitrogen are reacted.
(g) The gases that leave the reactor still contain nitrogen. One reason for this is that nitrogen is a relatively inert gas. Explain this property of nitrogen in terms of its bonding.

(h) The boiling points of nitrogen, hydrogen and ammonia are as follows:

<table>
<thead>
<tr>
<th>Gas</th>
<th>Boiling point</th>
</tr>
</thead>
<tbody>
<tr>
<td>nitrogen</td>
<td>-196°C</td>
</tr>
<tr>

Section A

Answer all questions in this section in the spaces provided.
The total mark for this section is 50.

A1. Four of the gases found in the air are nitrogen, oxygen, argon, and carbon dioxide.

(a) Draw straight lines which correctly match the gases and the descriptions shown on the right.

Gases
- Nitrogen
- Oxygen
- Argon
- Carbon dioxide

Description
- Relative mass = 32
- Relative mass = 40
- Relative mass = 44
- Relative mass = 28

(b) Study the 6 statements below. Put a tick (\(\checkmark\)) in the box if the statement is true.
- Air is a mixture. \(\checkmark\)
- All gases in air are elements. \(\checkmark\)
- The components in air are only made up of non-metals. \(\checkmark\)
- There are weak attractions between the molecules in air. \(\checkmark\)
- The gases in air have high melting and boiling points. \(\checkmark\)
- Liquid air does not have a fixed boiling point. \(\checkmark\)

If 4 ticks or less, ignore wrong ticks.
1 correct = 0m
2 correct = 1m
3 correct = 1m
4 correct = 2m
If 5 ticks or more, 1m

A3 A student carries out some tests on an unknown solution P which is known to contain 2 metallic cations and 1 anion. She recorded her observations and deductions in the table shown below.

<table>
<thead>
<tr>
<th>Expt No</th>
<th>Procedure</th>
<th>Observations</th>
<th>Deductions</th>
</tr>
</thead>
<tbody>
<tr>
<td>1a</td>
<td>To a solution of P, add sodium hydroxide solution</td>
<td>White ppt formed</td>
<td>Fe(^{2+}), Zn(^{2+}), Ca(^{2+}), or Fe(^{3+}) could be present</td>
</tr>
<tr>
<td>1b</td>
<td>Add excess sodium hydroxide solution into the test tube</td>
<td>Ppt decreased by approximately half; Remaining ppt is insoluble in excess sodium hydroxide</td>
<td>Ca(^{2+}) is present</td>
</tr>
<tr>
<td>2</td>
<td>Add Davardia’s alloy to the mixture in exp 1b</td>
<td>Warm the mixture; Gas evolved turns moist red litmus blue</td>
<td>Cl(^{-}) is present</td>
</tr>
<tr>
<td>3a</td>
<td>To new sample of solution P, add aqueous ammonia</td>
<td>White ppt formed</td>
<td>Al(^{3+}), Pb(^{2+}), or Zn(^{2+}) could be present</td>
</tr>
<tr>
<td>3b</td>
<td>Add excess aqueous ammonia solution into the test tube</td>
<td>White ppt insoluble in excess aqueous ammonia</td>
<td>Al(^{3+}) or Pb(^{2+}) could be present</td>
</tr>
</tbody>
</table>

(a) The student made 3 mistakes in her deductions. Experiment number in which the mistakes were made. Briefly explain your answer.

Mistake 1 1a Fe\(^{2+}\) ions cannot be present as it forms green ppt. 1m
Mistake 2 1b Aluminum ion (Al\(^{3+}\)) should also be a possible ion present as it forms white ppt with sodium hydroxide. 1m
Mistake 3 2 Nitrate ion (NO\(_3^-\)) should be present, not chloride. 1m

(b) Describe a simple test to differentiate between aluminium ions (Al\(^{3+}\)) and lead(II) ions (Pb\(^{2+}\)).

Add aqueous potassium iodide. 1m, only lead(II) ions will give yellow ppt. OR Add any solution containing chloride or sulphate ions (except of barium). 1m, only lead(II) ions will give white ppt. 1m

A2 The diagram below shows the main parts of an electric motor.

Graphite contacts are used to conduct electricity to the copper ring. When electricity passes through the wires, the copper ring rotates rapidly, turning the motor which is connected to the drill bit. The ring does not get stuck or become worn out.

(a) Explain, in terms of structure and bonding, why copper and graphite are able to conduct electricity:

Copper: Covalent bonding of copper atoms are delocalized. 1m

Electrons are mobile and able to move freely within metal lattice. 1m

Copper has charged particles. 1m

Protons in a sea of electrons. 1m

(b) Explain why the copper ring does not become worn out easily though it is in constant contact with the graphite during rotation.

Graphite is soft and slippery. 1m

Very little friction between the copper ring and graphite contacts. 1m

[NOT Accepted: Graphite has 3 valence out of 4 valence electrons involved in bonding (per atom not mentioned); Electrons bonded to each other; One carbon bonded to 3 electrons, 3 out of 4 carbon atoms bonded, leaving one free to conduct electricity; 3 out of 4]
The rate of reaction between hydrochloric acid and excess marble chips (calcium carbonate) was investigated at a temperature of 40°C using the apparatus shown in the diagram below:

Cotton wool
Dilute HCl
Marble chips
Top-pan balance

The mass of the flask and contents was measured every half minute for ten minutes. The data obtained was plotted on a graph shown in the grid below.

Graph to flatten at about 3.5 mins

(a) Complete the graph by drawing a line of best fit.
(b) Explain why the mass of the flask and contents decreased with time.

Carbon dioxide gas produced during the reaction escapes 1m

(b) Explanations must convey loss of carbon dioxide gas from the flask to the surroundings

(c) State the time taken for the reaction to complete 7 minutes 1m

(d) A student repeated the experiment but forgot to place the cotton wool at the neck of the conical flask. State how his results would be different and explain your answer

Mass readings will be lower than the actual mass. 1m
Without the cotton wool, some acid will be lost as acid spray. 1m

(e) Given that 40 cm$^3$ of hydrochloric acid were used in the reaction, calculate the concentration of this acid in mol/l

\[ \text{CaCO}_3 + 2\text{HCl} \rightarrow \text{CaCl}_2 + \text{H}_2\text{O} + \text{CO}_2 \]

Mass of carbon dioxide produced = 102.8 g - 99.0 g = 3.8 g
No of moles of carbon dioxide produced = \( \frac{3.8}{44} \) moles = 0.086364 mole 1m
2 moles of hydrochloric acid produces 1 mole of carbon dioxide
Hence, no of moles of hydrochloric acid present = \( 2 \times 0 \text{.086364mol} \) = 0.17273 moles 1m
Hence, concentration of hydrochloric acid = \( \frac{0.17273}{0.04} \) = 4.32 mol/l 1m

Another student repeated the first experiment at a temperature of 60°C. All other variables were kept the same.

(f) On the same grid on page 5, draw the graph she can expect to obtain for this experiment. Label this graph T 1m

(g) Explain, in terms of the collision theory, how an increase in temperature affects the rate of reaction

Particles gain kinetic energy and move faster or

More particles possess energy equal or greater than the activation energy. 1m
Frequency of collisions increases, number of effective collisions increases per unit time. 1m
Rate of reaction increases 1m

[Total 12]
A5 One method of manufacturing hydrogen is to pass methane and steam over heated nickel catalyst, a process called steam reforming

\[ \text{CH}_4 (g) + \text{H}_2\text{O} (g) \rightarrow \text{CO} (g) + 3\text{H}_2 (g) \]

(a) Using the bond energies listed in the table below, calculate the enthalpy change (\(\Delta H\)) of this reaction.

<table>
<thead>
<tr>
<th>Bond</th>
<th>Bond energy (kJ/mol)</th>
</tr>
</thead>
<tbody>
<tr>
<td>H-H</td>
<td>436</td>
</tr>
<tr>
<td>C-H</td>
<td>410</td>
</tr>
<tr>
<td>O-H</td>
<td>460</td>
</tr>
<tr>
<td>C-C</td>
<td>350</td>
</tr>
<tr>
<td>C=O</td>
<td>1046</td>
</tr>
</tbody>
</table>

No statements and wrong answer = 0, minus 1m for no units or sign
If statements/concepts correct but calculation wrong, max 1m

Energy taken in to break bonds in reactants
4 C-H bonds in methane = 4 x 410 = 1640 kJ
2 O-H bonds in water = 2 x 460 = 920 kJ
Total energy taken in = 1640 + 920 = 2560 kJ

Energy released when bonds are formed in products
1 CO bond = 1 x 1046 = 1046 kJ
3 H-H = 3 x 436 = 1308 kJ
Total energy released = 1046 + 1308 = 2354 kJ

Hence, \(\Delta H\) for reaction = 2560 - 2354 = 206 kJ

(b) Using your answer to part (a), draw the energy profile diagram using the axes given below, showing the activation energy and the enthalpy change clearly.

ECF If part a \(\Delta H\) wrong but all parts correct in part b, max 3m
Reject terms such as energy needed, required for both bond-making/breaking processes

(c) State whether this is an endothermic or exothermic reaction. Explain your answer in terms of bond breaking and bond forming.

Energy taken in to break the bonds in methane and steam is greater than
energy released when bonds are formed in carbon monoxide and hydrogen.
(or vice versa) hence it is an endothermic reaction

Energy taken in to break the bonds in reactants and energy released when bonds
are formed in products = 1m
Greater/lesser and endothermic reaction = 1m

[Total 8]
A6 The diagram below shows a food label describing the nutritional content of a packet of crackers.

**Nutrition Facts**

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

From the food label, it can be seen that the cracker contains both saturated and unsaturated fat.

(a) Describe a simple chemical test to differentiate between saturated fat and unsaturated fat.

Add aqueous bromine into the sample of fat and shake, 1m

Unsaturated fat will decolourise the reddish brown bromine, no visible change with saturated fat (Bromine remains brown) 1m

(b) Describe the main difference in structure between monounsaturated fat and polyunsaturated fat.

Monounsaturated fat has **one carbon-carbon double bond per molecule** compared to polyunsaturated which has many carbon-carbon double bonds in the molecules (or vice versa) 1m

Saturated fats are linked to heart problems, in order to be able to claim that their crackers are healthy, the manufacturer decides to use a vegetable oil which has a higher unsaturated fat content. In a test to determine what kind of vegetable oil is healthier, a laboratory investigation was carried out.

20 cm³ of different vegetable oils were titrated with bromine solution of concentration 0.50 mol/dm³. The results are shown in the table on page 10.

<table>
<thead>
<tr>
<th>Vegetable Oil</th>

<td>14.4</td>
<td>14.3</td>
</tr>
<tr>
<td>Sunflower</td>
<td>0.5</td>
<td>18.9</td>
<td>18.4</td>
</tr>
</tbody>
</table>

(c) Complete the table above. All values correct – 1m

(d) What colour change in the conical flask would be observed at the end point of the titration? From pale yellow/colourless to light brown. (Both colours correct 1m)

(e) Which is the healthiest vegetable oil to use to manufacture the crackers? Explain your answer

Healthiest vegetable oil, Sunflower oil, 1m

Reason Sunflower oil needs the **highest volume of bromine solution to react with it completely**, suggesting that sunflower oil is most unsaturated (has the largest number of carbon-carbon double bonds 1m

(f) Unsaturated vegetable oils can be hardened to make margarine. Describe how this process is carried out.

Care out hydrogenation (or react vegetable oil with hydrogen) at temperature of 200°C and nickel catalyst, 1m

[Total 9]
A7 The diagram below shows the structure of an ester molecule M

(a) Circle clearly on the above diagram the group of atoms which makes this molecule an ester. [1]

When M is reacted with water under reflux in the presence of a catalyst, an alcohol and a carboxylic acid are formed.

(b) Draw the structures of the 2 products formed.

\[
\begin{align*}
\text{Product 1} & \quad \text{Product 2} \\
\text{\small{1m}} & \quad \text{\small{1m}}
\end{align*}
\]

When M undergoes polymerization, a polymer called Perspex is formed.

(c) What type of polymer is Perspex? Give a reason for your answer.

Type of polymer: **Addition polymer**. [1]

Reason. M has a carbon-carbon double bond which allows addition polymerization to take place. [2]

(d) Draw the structure of Perspex, showing two repeat units.

\[
\begin{align*}
\text{\small{1m}} & \\
\text{\small{}}
\end{align*}
\]

Section B

Answer all three questions in this section

The last question is in the form of an equation and only one of the alternatives should be attempted.

B8 The Haber process, also called the Haber-Bosch process, is an artificial nitrogen fixation process and is the main industrial procedure for the production of ammonia today. It converts atmospheric nitrogen to ammonia by reacting it with hydrogen. Named after its inventors, German chemists Fritz Haber and Carl Bosch, who developed it in the first half of the twentieth century, the Haber process provided Germany with a source of ammonia for the production of explosives during World War I. Today, the ammonia is mainly used to produce fertilizers.

The diagram below shows how a modern ammonia manufacturing plant looks like.

\[
\begin{align*}
\text{Reactor} & \quad \text{Unreacted nitrogen and hydrogen} \\
\text{Cooling chamber} & \quad \text{Ammonia} \\
\text{Compression and heating chamber} & \quad \text{The mixture of ammonia, nitrogen and hydrogen from the reactor is cooled. Ammonia liquefies and separates from the mixture.}
\end{align*}
\]

The yield of ammonia can vary, depending on the temperature and pressure. The table below shows the percentage yield under different conditions.

(a) Write the equation (including state symbols) for the reaction between nitrogen and hydrogen in the Haber Process
\[ \text{N}_2 (g) + 3 \text{H}_2 (g) \rightleftharpoons 2 \text{NH}_3 (g) \quad 1 \text{m} \]

(b) State the main source of nitrogen and the process by which it is obtained
Fractional distillation of liquid air \[ 1 \text{m} \]

(c) Suggest why air is not used in the Haber process although 78% of air is nitrogen
Oxygen in the air will react with the hydrogen at high temperature and lower the yield of ammonia \[ 1 \text{m} \]

(d) The reactant gases are passed through a substance in the reactor. Name this substance and state its function
Substance: Finely divided iron \[ 1 \text{m} \]
Function: Catalyst to speed up reaction \[ 1 \text{m} \]

(e) From the information in the table, describe how temperature and pressure affect the yield of ammonia
The higher the temperature, the lower the yield \[ 1 \text{m} \]
The higher the pressure, the higher the yield \[ 1 \text{m} \]

(f) A particular ammonia plant uses a temperature of 400°C and pressure of 200 atm. Using the information in the table, calculate the mass of ammonia formed when 210 tonnes of nitrogen are reacted
From mass ratio of equation, 28 units of nitrogen yields 34 units of ammonia
Hence, 210 tonnes of nitrogen yield \( \frac{34}{28} \times 210 = 255 \) tonnes of ammonia \[ 1 \text{m} \]
From table, the yield at 400°C and 200 atm is 38.8%
Hence, the mass of ammonia formed = \( \frac{255}{38.8} \times 100 = 88.94 \) tonnes of ammonia \[ 1 \text{m} \]

(g) The gases that leave the reactor still contain nitrogen. One reason for this is that nitrogen is a relatively inert gas. Explain this property of nitrogen in terms of its bonding
Nitrogen is a very inert/reactive gas.
Each nitrogen molecule has 3 covalent bonds joining 2 nitrogen atoms. A lot of energy is required to break these bonds \[ 1 \text{m} \]

(h) The boiling points of nitrogen, hydrogen and ammonia are as follows

<table>
<thead>
<tr>
<th>Gas</th>
<th>Boiling point</th>
</tr>
</thead>
<tbody>
<tr>
<td>nitrogen</td>
<td>-196°C</td>
</tr>
<tr>
<td>hydrogen</td>
<td>-253°C</td>
</tr>
<tr>
<td>ammonia</td>
<td>-33°C</td>
</tr>
</tbody>
</table>

Suggest a suitable temperature that the cooling chamber must have to be able to function effectively
Temperature of cooling chamber: Any temp between -34°C and -196°C \[ 1 \text{m} \]

[Total: 12]
B9 The vertical columns in the Periodic Table are called Groups.

(a) Lithium is the first element in Group I.
   Describe what you will observe when a piece of lithium is put into water.
   - Lithium floats on the surface. 1m
   - Reject skip or jump. 1m
   - Splashing sound. 1m
   - Sparks. 1m (Any 2 points, 2m)

(b) Fluorine is the first element in Group VII.
   Describe and explain what you will observe when fluorine is bubbled in aqueous sodium iodide.
   - Iodine is not reddish brown! 1m
   - Water present so iodine formed in aqueous state not as a purple gas! 1m
   - Fluorine is more reactive than iodine and displaces the iodide ions to form brown aqueous iodine. 1m
   - Fluorine is a white / black precipitate will be seen. 1m
   - Iodine is more reactive than iodine and displaces the iodide ions to form brown aqueous iodine. 1m
   - NOT fluorine is more reactive than iodine; NOT iodide ion not. 1m
   - Iodine ion! 1m

(c) Lithium reacts with fluorine to form lithium fluoride which melts at 845°C.

(i) Explain why lithium fluoride has a high melting point.
   - Lithium fluoride has giant crystal lattice structure. 1m
   - Strong electrostatic force of attraction between lithium and fluoride ions, a lot of energy is required to break force of attraction, hence high m.p. 1m

(ii) Draw the ‘dot and cross’ diagram to show the bonding in lithium fluoride.

[Diagram of lithium fluoride showing bonding]
EITHER

B10 A student carried out the electrolysis of 2 equal volumes of silver nitrate solutions of the same concentration using platinum electrodes as shown in the diagram below.

In Experiment 1, a current of 1.0 amperes was used and the mass of one of the electrodes was weighed every 5 minutes to determine the mass of the silver deposited. This was done for 60 minutes. The results in the following table are plotted on the grid on page 18.

<table>
<thead>
<tr>
<th>Time (min)</th>
<th>0</th>
<th>5</th>
<th>10</th>
<th>15</th>
<th>20</th>
<th>25</th>
<th>30</th>
<th>35</th>
<th>40</th>
<th>45</th>
<th>50</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mass of silver deposited (g)</td>
<td>0</td>
<td>0.30</td>
<td>0.60</td>
<td>0.90</td>
<td>1.20</td>
<td>1.50</td>
<td>1.80</td>
<td>2.10</td>
<td>2.40</td>
<td>2.80</td>
<td>3.00</td>
</tr>
</tbody>
</table>

In Experiment 2, the student repeated the procedure using the same volume of aqueous silver nitrate solution but he increased the current to 1.5 amperes instead. The results are shown in the following table.

<table>
<thead>
<tr>
<th>Time (min)</th>
<th>0</th>
<th>5</th>
<th>10</th>
<th>15</th>
<th>20</th>
<th>25</th>
<th>30</th>
<th>35</th>
<th>40</th>
<th>45</th>
<th>60</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mass of silver deposited (g)</td>
<td>0</td>
<td>0.45</td>
<td>0.90</td>
<td>1.35</td>
<td>1.80</td>
<td>2.25</td>
<td>2.70</td>
<td>?</td>
<td>2.80</td>
<td>3.00</td>
<td>3.00</td>
</tr>
</tbody>
</table>

(a) Name the electrode that was weighed in the experiment. Write the equation for the reaction which takes place at this electrode.

Electrode: Cathode 1m
Equation: \( Ag^{+}(aq) + e^{-} \rightarrow Ag(s) \) 1m

(b) Plot the graph of mass of silver deposited against time for Experiment 2 on the same grid on page 18. Label the graph "Experiment 2" clearly.

Remark: The tables show an increase in mass of the electrode so this must be the cathode. Silver ions are preferentially discharged to form silver solid on the cathode.

(c) Determine the mass of silver deposited after 35 minutes for the second experiment.

2.80 g 1m

(d) State two conclusions from the results of the experiments.

- Mass of silver deposited is directly proportional to time. 1m
- The longer the current, the faster the rate of the silver deposited. 1m OR An increase in current from 1 ampere to 1.5 amperes has no effect on the final mass of silver deposited. 2m
The two experiments involve mass of silver deposited, time and current so conclusions should be specific to these factors and their relationships.

Rejected
The final mass of silver for both experiments is 2.80 g (not a conclusion based on experiments but a fact). An increase in current increases the rate of reaction/rate of electrolysis (not specific enough).

When the same volume and concentration of solution is used, the mass of silver deposited will be the same. (True but not based on experiments, we did not vary volume/concentration to investigate this.)

(e) State a change in the electrolyte at the end of the electrolysis of the two silver nitrate solutions.

The electrolyte becomes more acidic or pH decreases 1m OR

Concentration of silver ions decreases 1m

(f) If the electrolyte were replaced by copper(II) sulfate solution and the same current of 1 ampere was passed through, calculate the mass of copper deposited at the end of 40 minutes.

Number of moles of silver deposited = \( \frac{2.80}{100} \) mole = 0.022222 mole 1m

\[ \text{Ag}^+(aq) + e^- \rightarrow \text{Ag} (s) \]

1 mole of silver ions takes 1 mole of electrons to form 1 mole of silver.

Hence, 0.022222 mole of silver has combined with 0.022222 mole of electrons.

\[ \text{Cu}^{2+}(aq) + 2e^- \rightarrow \text{Cu} (s) \]

Cu²⁺ ions take twice the number of electrons to form 1 mole of copper.

Hence, number of moles of copper deposited by 0.022222 mole of electrons:

\[ 0.5 \times 0.022222 = 0.011111 \text{ mole} 1m \]

Mass of copper deposited = 0.011111 x 64 = 0.711 g (3 s.f.) 1m

Rejected.
Mass of copper deposited = 2.40/2 = 1.20 g (Ratio of masses if ratio of moles) [Total 10]
(c) Complete the diagram below to show the new levels of the aqueous sodium nitrate solution after the switch is closed for a while and hence the relative volumes of gases collected in tube X and tube Y. Label clearly the gases collected in each tube.

- Correct ratio of gases – 1m
- Correct label of gases – 1m

Aqueous sodium nitrate

Corrected diagram:

Oxygen - Tube X
Hydrogen - Tube Y

(c) Electrode X is then replaced by a copper rod. State an observation and explain your answer.

Observation: Electrolyte will turn blue OR size of copper decreases 1m

Explanation: Copper electrode (the anode) ionizes to form copper(ii) ions which is blue, hence electrolyte turns blue OR copper electrode becomes smaller as copper ionizes 1m

(c) State and explain an observation that can be made in Cell 2 during the experiment.

Observation: Size of zinc decreases OR bubbles seen at silver electrode 1m

Explanation: zinc, the more reactive metal, ionizes to form zinc ions OR hydrogen ions accept electrons to form hydrogen gas 1m

Rejected
Reddish brown solid deposited on electrode Y (this does not happen immediately, at the beginning effervescence is seen as hydrogen ions are preferentially discharged)
1. A crystal of iodine produces a coloured vapour when gently heated. Which pair of statements correctly describes this process?

<table>
<thead>
<tr>
<th>type of bond broken</th>

2. A mixture of copper, magnesium and zinc is added to an excess of dilute sulfuric acid. The resulting mixture is then filtered.

What is the colour of the filtrate?

A. blue
B. colourless
C. grey
D. pink

3. Which of these pairs of aqueous ions both react with dilute sulfuric acid to give a visible result?

A. Ba<sup>2+</sup> and Cl<sup>-</sup>
B. Ba<sup>2+</sup> and CO<sub>3</sub><sup>2-</sup>
C. NH<sub>4</sub><sup>+</sup> and Cl<sup>-</sup>
D. NH<sub>4</sub><sup>+</sup> and CO<sub>3</sub><sup>2-</sup>
4 Which atom has twice as many neutrons as protons?
A $^1_1$H
B $^2_1$H
C $^3_1$H
D $^1_1$H

5 The $^{68}$Ga isotope is medically useful because it undergoes a natural radioactive process to give a gallium isotope, $^{68}$Ga, which can be used to detect tumours. This transformation of $^{68}$Ge occurs when an electron enters the nucleus, changing a proton into a neutron.

Which statement about the composition of an atom of the $^{68}$Ga isotope is correct?
A It has 3 shells
B It has 5 electrons in its outer shell
C It has 37 neutrons
D Its proton number is 32

6 Hard water contains calcium ions and hydrogen carbonate ions arising from dissolved calcium hydrogen carbonate, Ca(HCO$_3$)$_2$.

How many electrons are present in the hydrogen carbonate ion?
A 30
B 31
C 32
D 33

7 Boron is a non-metallic element which is placed above aluminium in Group III of the Periodic Table. It forms a compound with nitrogen known as boron nitride which has a structure similar to graphite.

Which of the following conclusions can be drawn from this information?
1 The empirical formula of boron nitride is BN
2 The boron and nitrogen atoms are likely to be arranged alternately in a hexagonal pattern.
3 Boron nitride has a layer structure with intermolecular forces of attraction between the layers.
A 1 only
B 1 and 2 only
C 2 and 3 only
D 1, 2 and 3

10 The diagram shows an experiment to find the formula of magnesium oxide.

Which piece of apparatus would be needed in addition to those shown?

A a balance
B a measuring cylinder
C a stopwatch
D a thermometer

11 Nickel makes up 20% of the total mass of a coin. The coin has a mass of 10.0 g.

How many nickel atoms are there in the coin?
A \(2.03 \times 10^{22}\)
B \(4.29 \times 10^{22}\)
C \(2.14 \times 10^{22}\)
D \(1.20 \times 10^{24}\)

12 On collision, airbags in cars can inflate rapidly due to the production of nitrogen gas. The nitrogen is formed according to the following equations:

\[2\text{NaN}_3 \rightarrow 2\text{Na} + 3\text{N}_2\]
\[10\text{Na} + 2\text{KNO}_3 \rightarrow \text{K}_2\text{O} + 5\text{Na}_2\text{O} + \text{N}_2\]

How many moles of nitrogen gas are produced from 1 mol of sodium azide, \(\text{NaN}_3\)?
A 1.5
B 1.6
C 3.2
D 4.0

13 Which oxide, when mixed with water, will produce the solution with the lowest pH?
A \(\text{CO}\)
B \(\text{Na}_2\text{O}\)
C \(\text{P}_2\text{O}_5\)
D \(\text{SiO}_2\)

14 A sample of soil has a nitrogenous fertiliser in the form of an ammonium salt added to it. The ammonium salt dissolved in the water in the soil.

When tested a week later, the water in the soil contained 15.3% of dissolved nitrogen and had a pH of 4.6.

Calcium hydroxide was added to the soil and then the water in the soil was tested the next day, both for nitrogen content and pH.

What would be the most likely result of the final test?

<table>
<thead>
<tr>

Student P concluded that X is a weak base.
Student Q concluded that the extent of dissociation is lower in \(X_{\text{aq}}\) than in \(Y_{\text{aq}}\).

Which of the students are correct?
A both P and Q
b neither P and Q
C P only
D Q only
16 A student puts 10 cm³ of 0.100 mol/dm³ nitric acid into one test-tube and 10 cm³ of 0.100 mol/dm³ ethanoic acid into another test-tube. He then adds 1.0 g (an excess) of magnesium ribbon to each test-tube and takes suitable measurements. Both acids have the same starting temperature.

Neither reaction is complete after 2 minutes, but both are complete after 20 minutes.

Which statements are correct?

1. After 2 minutes, the nitric acid is at a higher temperature than the ethanoic acid.
2. After 2 minutes, the nitric acid has produced more gas than the ethanoic acid.
3. After 20 minutes, the nitric acid has produced more gas than the ethanoic acid.

A 1 only  
B 1 and 2 only  
C 2 and 3 only  
D 1, 2 and 3

17 Rat poison needs to be insoluble in rain water but soluble at the low pH of stomach contents.

What is a suitable barium compound to use for rat poison?

A barium carbonate
B barium hydroxide
C barium nitrate
D barium sulfate

18 In which equation is the underlined substance acting as a reducing agent?

A $\text{SCN}^- + \text{Fe}_2\text{O}_3 \rightarrow 2\text{Fe} + 3\text{SCN}^-$
B $\text{CO}_2 + \text{C} \rightarrow 2\text{CO}$
C $\text{Cu}_2\text{O} + \text{H}_2 \rightarrow \text{Cu} + \text{H}_2\text{O}$
D $\text{CaO} + \text{H}_2\text{O} \rightarrow \text{Ca(OH)}_2$

19 Sulfur dioxide, $\text{SO}_2$, is added to wines to prevent oxidation of ethanol by air. To determine the amount of $\text{SO}_2$ a sample of wine is titrated with iodine, $\text{I}_2$. In this reaction, one mole of $\text{SO}_2$ is oxidised by one mole of $\text{I}_2$.

What is the change in oxidation number of sulfur in this reaction?

A $+2 \rightarrow +4$  
B $+4 \rightarrow +6$  
C $+6 \rightarrow +4$  
D $+4 \rightarrow +2$

20 A metal has the following properties:
- It does not react with cold water.
- It reacts with dilute hydrochloric acid.
- It cannot be extracted from its oxide using carbon.

Between which two metals in the reactivity series should it be placed?

A calcium and magnesium
B iron and copper
C magnesium and zinc
D zinc and iron

21 Which of the following carbonates shows the least change in mass after strong heating?

A calcium carbonate
B copper(II) carbonate
C sodium carbonate
D silver carbonate
22. Some calcium carbonate and hydrochloric acid start to react
   What happens to the speed of the reaction?
   A. It decreases
   B. It increases
   C. It stays the same.
   D. It stops

23. A student investigates the rate of reaction between marble chips and hydrochloric acid.
   The loss in mass of the reaction flask is measured.
   The graph shows the results of two experiments, P and Q.

   Which change explains the difference between P and Q?
   A. A catalyst is added in P.
   B. A higher temperature is used in P.
   C. A higher pressure is used in Q.
   D. Powdered marble chips are used in Q.

24. The following report appeared in a newspaper:
   Drums of bromine broke open after a vehicle crash on the motorway. Traffic was
   diverted as purple gaseous bromine drifted over the road (it is denser than air),
   causing irritation to drivers' eyes. Firemen sprayed water over the scene of the
   accident, dissolving the bromine and washing it away.

   What is wrong with the report?
   A. Bromine does not dissolve in water.
   B. Bromine does not vapourise readily.
   C. Bromine is less dense than air.
   D. Bromine is not purple.

25. The diagram shows the circuit for electrolysis of lead(II) bromide and sodium chloride to
    liberate the metal.

   In which form are these salts electrolysed for liberating the metal?

27 The ability of an atom in a covalent bond to attract electrons to itself is called its electronegativity.

The greater the difference between the electronegativities of the two atoms in the bond, the more polar the bond.

Which pair will form the most polar covalent bond between the atoms?

- A chlorine and bromine
- B chlorine and iodine
- C fluorine and chlorine
- D fluorine and iodine

28 Which substance does not produce a poisonous gas when burnt in a limited amount of air?

- A hydrogen
- B methane
- C propane
- D sulfur

29 Which gas is present in the exhaust fumes of a car engine in a much greater amount than any other gas?

- A carbon dioxide
- B carbon monoxide
- C nitrogen
- D water vapour

30 When solid ammonium chloride is added to water, a solution is formed.

Which row correctly shows the temperature change and the type of reaction taking place?

These bond energy values relate to the following four reactions:

- P: Br₂ → 2Br
- Q: 2Cl → Cl₂
- R: CH₃ + Cl → CH₂Cl
- S: CH₄ + CH₂ + H

What is the order of enthalpy changes of these reactions from most negative to most positive?

A: P → Q → R → S
B: Q → R → S → P
C: R → Q → P → S
D: S → P → Q → R

32 Ethanol is a fuel used in cars. It can be made from petroleum.

- C₂H₆O → C₂H₄ + C₂H₆
- C₂H₄ + H₂O → C₂H₅OH
- C₂H₅OH + 3O₂ → 2CO₂ + 3H₂O

Compounds of how many homologous series appear in these equations?

A: 1  B: 2  C: 3  D: 4

33 The compound 2-methylpropene, C₄H₈, is a monomer used in the production of synthetic rubber.

In addition to 2-methylpropene there are x other isomers of C₄H₈ which contain a double bond.

What is the value of x?

A: 1  B: 2  C: 3  D: 4

34 One of the reactions taking place in a catalytic converter in a car exhaust system is between nitrogen oxide and octane (unburned petrol). The products of this reaction are non-toxic.

Which is the correct equation for the reaction?

A: C₆H₁₆ + 16NO → 8CO + 8N₂ + 6H₂O
B: C₆H₁₆ + 24NO → 8CO₂ + 12N₂ + 6H₂O
C: C₆H₁₆ + 17NO → 8CO + 8N₂ + 6H₂O
D: C₆H₁₆ + 25NO → 8CO₂ + 12N₂ + 9H₂O
35 Which hydrocarbon would not be collected in the inverted tube by heating pentane, CH₃(C₂H₅)₂CH, in the apparatus shown?

A CH₄
B CH₃CH₃
C CH₃CH₂CH₂CH₂CH₂
D CH₃(CH₃)₂CH₂

36 A pure hydrocarbon is used in bottled gas for cooking and heating.

Exactly 50 cm³ of oxygen is needed for complete combustion of 10 cm³ of the hydrocarbon.

30 cm³ of carbon dioxide is produced

All gaseous volumes were measured at room temperature and pressure.

What is the formula of the hydrocarbon?

A C₄H₆
B C₅H₈
C C₆H₁₀
D C₇H₁₆

37 The solubility of the carboxylic acids in water decreases as the size of the carboxylic acid molecules increases.

Which carboxylic acid is the least soluble in water?

A butanoic acid
B ethanoic acid
C methanoic acid
D propanoic acid

38 Sorbic acid is used as a food preservative because it kills fungi and moulds.

Sorbic acid will react with
- hydrogen in the presence of a nickel catalyst,
- bromine in an organic solvent

How many moles of hydrogen and of bromine will be incorporated into one mole of sorbic acid by these reactions?

<table>

READ THESE INSTRUCTIONS FIRST

Write in blue or black ink. You may use a calculator.

Section A
Answer all the questions in the spaces provided.

Section B
Answer all three questions, the last question is in the form either/or.

The number of marks is given in brackets [ ] at the end of each question or part of the question. Omission of essential working will result in loss of marks. A copy of the Periodic Table is printed on page 20.

This question paper consists of 20 printed pages.

Setter: Mr Hoon Yeng Wei
Vetter: Mr Goh Wee Bin and Mdm Tan Pui San

We Nurture Students to Think, Care and Lead with P.R.I.D.E.
Section A (50 Marks)

Answer all the questions in the spaces provided.

A1 The diagram shows the structures of various compounds.

<table>
<thead>
<tr>
<th>substance</th>

</table>

Use the letters A to F to answer the following questions. Each compound may be used once, more than once or not at all.

(a) Which substance could be a metal?

............................................................................................................................................[1]

(b) State all the substances that are liquid at room temperature?

...............................................................................................................................................[1]

(c) Which substance could have a macromolecular structure similar to that of silicon(IV) oxide?

.............................................................................................................................................[1]

(d) Which substance could be propane?

...............................................................................................................................................[1]

(e) Which substance could be sodium chloride?

...............................................................................................................................................[1]
A2 The table shows some properties of the Group I metals.

<table>
<thead>
<tr>
<th>metal</th>
<th>density in g / dm³</th>
<th>melting point / °C</th>
<th>boiling point / °C</th>
</tr>
</thead>
<tbody>
<tr>
<td>lithium</td>
<td>0.53</td>

<td>29</td>
<td>669</td>
</tr>
</tbody>
</table>

(a) (i) Describe the general trend in the density of the Group I metals.

.................................................................................................................................................[1]

(ii) Predict the boiling point of potassium.

.................................................................................................................................................[1]

(iii) What is the physical state of caesium at 35 °C? Explain your answer.

.................................................................................................................................................[1]

(b) (i) Describe the trend in reactivity of the Group I metals with water.

.................................................................................................................................................[1]

(ii) Construct the equation for the reaction of rubidium with water.

.................................................................................................................................................[1]

(iii) The reaction of rubidium with water is exothermic. What is meant by the term *exothermic*?

.................................................................................................................................................[1]
(c) Sodium and calcium form ionic hydrides containing the hydride ion, H\(^{-}\). Sodium and calcium hydrides react with water to form the hydroxide and hydrogen.

\[
\text{NaH} + \text{H}_2\text{O} \rightarrow \text{NaOH} + \text{H}_2 \\
\text{CaH}_2 + 2\text{H}_2\text{O} \rightarrow \text{Ca(OH)}_2 + 2\text{H}_2
\]

Deduce the general ionic equation for these reactions.

.................................................................[1]

(d) Sodium is a soft metal with little catalytic activity.
Nickel is a hard metal which is often used as a catalyst.

(i) Describe two other differences in the physical properties of sodium and nickel.

1 .................................................................

.................................................................

2 .................................................................

.................................................................[2]

(ii) State one industrial use of nickel as a catalyst.

.................................................................[1]

(iii) Explain why an alloy of nickel and copper is less malleable than copper alone.

.................................................................

.................................................................

.................................................................

.................................................................[2]
A3 The melting point of sodium chloride is 801 °C. The melting point of chlorine is -101 °C.

(a) Explain, in terms of structure and bonding, the difference between the melting points of these two substances.

........................................................................................................................................[3]

(b) Explain why molten sodium chloride conducts electricity but solid sodium chloride does not.

........................................................................................................................................[2]
A4 Sulfuric acid reacts with the alkali sodium hydroxide.

\[
\text{H}_2\text{SO}_4 + 2\text{NaOH} \rightarrow \text{Na}_2\text{SO}_4 + 2\text{H}_2\text{O}
\]

(a) Write the ionic equation for this reaction.

........................................................................................................[1]

(b) The graph below shows how the pH changes when aqueous sulfuric acid is added slowly to 45.0 cm$^3$ of 0.190 mol / dm$^3$ sodium hydroxide until the acid is in excess.

![Graph showing pH vs. volume of acid added]

(i) What volume of acid has been added when the pH is 7?

.............................................................................................................................[1]
(ii) Use your answer to part (i) to calculate the concentration, in mol/dm$^3$, of the sulfuric acid.

\[ \text{concentration of sulfuric acid} = \boxed{\text{your calculation}} \]

(c) The experiment was repeated using ethanoic acid of the same concentration as the sulfuric acid. The same volume and concentration of aqueous sodium hydroxide was used.

(i) The volume of ethanoic acid required to neutralise the aqueous sodium hydroxide was twice as great compared with the volume of sulfuric acid.

Explain why.

\[ \boxed{\text{Your explanation}} \]

(ii) Suggest the value of the pH after excess ethanoic acid has been added.

\[ \boxed{\text{Your suggested value}} \]

(d) Sulfuric acid is one of the acids present in acid rain.

(i) Suggest how sulfuric acid is formed in the atmosphere.

\[ \boxed{\text{Your suggestion}} \]
(ii) State one effect of acid rain on human health.

A5 Chromium is a transition element.

(a) (i) State two differences in the physical properties of chromium and sodium.

(ii) State two differences in the chemical properties of chromium and sodium.

(b) Chromium is used in minute amounts in producing stainless steel. Chromium is also used to electroplate steel objects. The diagram shows how this could be done.

(i) Suggest two reasons why steel objects are plated with chromium.

---

[1] [2] [2]
(ii) Write the ionic half-equation for the reaction at the negative electrode.

...................................................................................................................................................... [1]

(iii) During the electroplating process, a colourless gas is formed at the positive electrode. Suggest the name for this gas and describe the test for it.

................................................................................................................................................................
................................................................................................................................................................
................................................................................................................................................................
................................................................................................................................................................
................................................................................................................................................................ [2]

(iv) During electroplating, it is necessary to add more chromium(III) sulfate but during copper plating using a copper anode, it is not necessary to add more copper(II) sulfate. Explain this difference.

................................................................................................................................................................
................................................................................................................................................................
................................................................................................................................................................
................................................................................................................................................................
................................................................................................................................................................
................................................................................................................................................................ [2]
A7 Iodine reacts with chlorine to form dark brown iodine monochloride.

\[ I_2 + Cl_2 \rightarrow 2\text{ICl} \]

(a) Calculate the overall energy change for the reaction between iodine and chlorine using the bond energy values shown.

<table>
<thead>
<tr>
<th>bond</th>
<th>energy / kJ per mol</th>
</tr>
</thead>
<tbody>
<tr>
<td>I - I</td>
<td>151</td>
</tr>
<tr>
<td>Cl - Cl</td>
<td>242</td>
</tr>
<tr>
<td>I - Cl</td>
<td>208</td>
</tr>
</tbody>
</table>

Show your working.
(b) Draw a labelled energy level diagram for the reaction between iodine and chlorine using the information in (a). Label 'activation energy' and 'ΔH'.

[3]
Section B

Answer all three questions from this section.
The last question is in the form either/or and only one of the alternatives should be attempted.
The total mark for this section is 30

B8 The ester, ethyl ethanoate, reacts with hydroxide ions to form ethanoate ions and ethanol.

The graph shows how the concentration of ethanoate ions, $\text{CH}_3\text{COO}^-$, changes as the reaction proceeds at 25 °C.

![Graph showing concentration of CH$_3$COO$^-$ ions in mol/dm$^3$ over time]

(a) Write a balanced chemical equation for the reaction.

.............................................................................................................................................[1]
(b) Describe and explain, using the kinetic particle theory, the change in the rate of reaction with time in the above graph.

(c) Use the information in the graph to deduce the mass of ethanoate ions in 200 cm$^3$ of solution when the reaction is complete.

(d) Use the information in the graph to calculate the average rate of reaction, in mol / dm$^3$ / s, during the first 300 seconds.

(e) Describe how, and explain why, the rate of reaction changes with increase in concentration of hydroxide ions.

(f) Sketch on graph, the curve you would expect if the reaction is done at 40 °C. Label this curve H.
There are two types of polymerisation, addition and condensation.

(a) Explain the difference between these two types of polymerisation.

(b) Some plastics, formed by polymerisation, are non-biodegradable. Describe two pollution problems that are caused by non-biodegradable plastics.

(c) The polymer known as PVA is used in paints and adhesives. Its structural formula is shown below.

\[
\text{CH}_2\text{CHCH}_2\text{CH}_3 \quad \text{OCOCH}_3 \quad \text{OCOCH}_3
\]

Deduce the structural formula of its monomer.

(d) The structural formulae of butenediolic acid and ethane-1,2-diol are shown.

\[
\text{HO} \quad \text{HO} \\
\text{HC} = \text{CH} \\
\text{butenediolic acid}
\]

\[
\text{H} \quad \text{O} \quad \text{C} \quad \text{O} \quad \text{H} \\
\text{H} \quad \text{H} \\
\text{ethane-1,2-diol}
\]
Describe the visible observations when butenediol acid or ethane-1,2-diol reacts with

(i) aqueous bromine

(ii) aqueous sodium carbonate

(iii) acidified potassium(VII) manganate

(e) Butenediol acid and ethane-1,2-diol can undergo condensation polymerisation under the right conditions to form a polymer W.

Draw the structural formula of a repeat unit of the polymer W and circle the group that links the monomers together.

(f) Butenediol acid can undergo self-polymerisation under the right conditions to form a polymer X.

Draw the structural formula of two repeat units of the polymer X.
Either

(a) Suggest why the steel alloy is coated with tin for use in food containers.

..........................................................................................................................[1]

(b) Draw the 'dot-and-cross' diagram to show the bonding in tin(IV) chloride. Show outer electrons only.

..........................................................................................................................[2]

(c) Is the bonding in this compound ionic or covalent? Give an explanation for your answer.

..........................................................................................................................[2]

(d) Construct the balanced chemical equation for the decomposition of tin(IV) chloride. Explain why this decomposition is an example of a redox.

..........................................................................................................................[2]
(e) Calculate the mass volume of chlorine gas produced from the decomposition of 30 g of tin(IV) chloride.

[3]
A 6.30 g sample of hydrated ethanedioic acid, H$_2$C$_2$O$_4$.xH$_2$O, was dissolved in water and the solution made up to 250 cm$^3$.

A 25.0 cm$^3$ sample of this solution was acidified and titrated with 0.100 mol / dm$^3$ potassium manganate(VII) solution. 20.0 cm$^3$ of this potassium manganate(VII) solution was required to react fully with the ethanedioate ions, C$_2$O$_4^{2-}$, present in the sample.

(a) The MnO$_4^{-}$ ions in the potassium manganate(VII) oxidise the ethanedioate ions.

(i) How does the oxidation state of Mn change during the reaction?

(ii) Complete and balance the ionic equation for the reaction between the manganate(VII) ions and the ethanedioate ions.

\[
2\text{MnO}_4^{-}(aq) + 5\text{C}_2\text{O}_4^{2-}(aq) + \ldots \ldots \text{H}^{+}(aq) \rightarrow \ldots \ldots \text{Mn}^{2+}(aq) + 10\text{CO}_2(aq) + \ldots \ldots \text{H}_2\text{O}(l)
\]

(b) (i) Calculate the number of moles of manganate(VII) used in the titration.

(ii) Calculate the relative formula mass of H$_2$C$_2$O$_4$.xH$_2$O.
(ii) The relative formula mass of anhydrous ethanedioic acid, \( \text{H}_2\text{C}_2\text{O}_4 \), is 90. Calculate the value of \( x \) in \( \text{H}_2\text{C}_2\text{O}_4 \cdot x\text{H}_2\text{O} \).

(c) (i) Suggest and draw the full structural formula of anhydrous ethanedioic acid, \( \text{H}_2\text{C}_2\text{O}_4 \).

(ii) Draw the 'dot-and-cross' diagram to show the bonding in anhydrous ethanedioic acid, \( \text{H}_2\text{C}_2\text{O}_4 \).

~ End of paper ~
The volume of one mole of any gas is 24 L at room temperature and pressure (298K).

| f2 | B 1 0 a The fin acts as a protective layer and prevents the fish from being injured by sharp objects. [1] b The body is opaque. [1] This is because soluble has a relatively low boiling point. [1] c [1] 1m for correct bonding 1m for all correct valence electrons.
d  
SnCl₄ + Sn = 2 Cl₂  [1]  
The oxidation states of Sn in SnCl₄ has decreased from +4 to 0 in Sn and SnCl₂ is reduced. Chlorine in SnCl₂ has increased from -1 to 0 in Cl₂ and SnCl₂ is oxidised. [1] Thus the reaction is a redox reaction.  

No of moles of SnCl₂ = 90/591  
= 0.11494 mol [1]  
Comparing mole ratio, Cl₂ / SnCl₂ = 2/1  
No of moles of acton = 2 x 0.11494  
= 0.22988 mol  
Volume of chlorine gas produced = 0.22988 x 24  
= 5.48 dm³ (std) [1]  

(e)  
2MnO₄⁻(aq) + 5Cr₂O₇²⁻(aq) + 16H⁺(aq) → 2Mn²⁺(aq) + 10CO₂(g) + 8H₂O(l)  

f)  
The oxidation states of Mn in MnO₄⁻ decrease from +7 to +2 in Mn²⁺  

b)  
No of moles of MnO₄⁻ = 0.07 x 0.100  
= 2 x 10⁻³ mol  

Comparing mole ratio, Cr₂O₇²⁻ / MnO₄⁻ = 5/2  
No of moles of Cr₂O₇²⁻ = 5 x 2 x 10⁻³  
= 6 x 10⁻³ mol  

No of moles of Cr₂O₇²⁻ in 0.3 g = 0.3 x 6 x 10⁻³ x 269.25  
= 0.05 mol [1]  
Relative molecular mass of H₂CrO₇ + H₂O = 83.0  
= 125 [1]  

b.ii)  
Value of x = [(125 - 90) / 18]  
= 2  

(c)  
*Students need to refer to (e)* and draw the representative 'box and cross' diagram.  
1m for correct bonding
1. Food dyes, 1 and 2 are known to contain one or more of three substances X, Y and Z. Two chromatograms are developed, one used water as the solvent, and the other used ethanol. The results are shown in the diagram below.

Which of the following statement(s) is/are correct?

I. There is a component in Sample 1 that is insoluble in water but soluble in ethanol.
II. The component in Z is more soluble in water than in ethanol.
III. Substance Z is likely to be pure.

A. I only
B. II only
C. I and III only
D. II and III only

2. In a porous pot experiment, the porous pot was placed in a beaker of carbon dioxide. The porous pot was joined to a U tube filled with mercury as shown.

Which of the gases, I to IV, when used to fill the porous pot would cause level A to move up?

3 Lead(II) sulfate is soluble in hot water, but not in cold water. Lead(II) sulfate boils off at 2670 °C while sodium sulfate boils at 1430 °C.
Which method is most suitable for obtaining a pure, dry sample of lead(II) sulfate from a hot solution of lead(II) sulfate and sodium sulfate?
A Cool the mixture, filter and collect the residue
B Cool the mixture, filter and evaporate the filtrate.
C Heat the mixture gently and collect the substance which boils off
D Heat the mixture gently and collect the substance which is left in the boiling flask.

4 A giant molecule is made up of a large amount of carbon, mainly isotopes $^{12}$C and $^{13}$C. It was found that the average relative atomic mass of carbon in the molecule is 12.2.
What is the ratio by mass of $^{12}$C to $^{13}$C?
A 4 : 1
B 1 : 4
C 3 : 4
D 3 : 1

5 The diagram below shows the electron arrangement in the outer shells of four elements, labelled (i) to (iv).

Which two elements will form an ionic compound with formula of the type $XY_2$?
A I and III
B III and IV
C II and III
D II and IV

6 Carbon monoxide is an air pollutant which is included in our PSI index and is generated by incomplete combustion of carbon containing fuels. Which is the electronic structure, showing the outermost electrons of carbon monoxide?
A $2s^2 2p^2$
B $3s^2 3p^2$
C $2s^2 2p^3$
D $2s^2 2p^4$

7 Silicon carbide has a similar structure to diamond. Which one of the following are advantages of using a silicon carbide ceramic compound instead of steel?
- Silicon carbide has a higher melting point.
- Silicon carbide is more resistant to oxidation.
- Silicon carbide is less likely to deform under compression.
A I, II and III
B I and II only
C II and III only
D II only

8 A flame cauldron is specially designed and created for every Olympic games. One of the materials commonly used is soda-lime glass as it can withstand high temperatures of over 2000°C when the cauldron is lit during each opening ceremony. The structure of soda-lime glass is shown below.

Soda-lime glass is prepared by melting calcium carbonate, sodium carbonate and silicon dioxide in a furnace. What bond(s) is/are present in soda-lime glass?
A covalent only
B covalent and ionic only
C ionic and metallic only
D metallic and covalent only

9 Chlorine gas is a severe irritant to the eyes and respiratory system. The maximum safe tolerance level of chlorine gas in air is 0.005 mg dm$^{-3}$. How many molecules of chlorine gas are present in 1 dm$^3$ of air at this tolerance level? (Note 1g = 1000 mg)
A 0.005/6 x 10$^{23}$ x 71
B 0.005/71 x 6 x 10$^{23}$
C 0.005/1000 x 1/71 x 6 x 10$^{23}$
D 0.005/1000 x 71 x 6 x 10$^{23}$

10 A mixture of 10 cm$^3$ of oxygen and 50 cm$^3$ of hydrogen is sparked continuously. What is the theoretical decrease in volume at room temperature and pressure?
A 10 cm$^3$
B 15 cm$^3$
C 20 cm$^3$
D 60 cm$^3$
11 In a pathology laboratory, a sample of urine containing 0.120 g of urea, \( \text{NH}_2\text{CONH}_2 \) (Mr = 60) was treated with an excess of nitrous acid. The urea reacted according to the following equation

\[
\text{NH}_2\text{CONH}_2 + 2\text{HNO}_2 \rightarrow \text{CO}_2 + 2\text{N}_2 + 3\text{H}_2\text{O}
\]

The gas produced was passed through aqueous sodium hydroxide and the final volume measured. What was this final volume of gas left behind at room temperature and pressure?

\[
\begin{align*}
\text{A} & : 0 \text{ cm}^3 \\
\text{B} & : 14.4 \text{ cm}^3 \\
\text{C} & : 480 \text{ cm}^3 \\
\text{D} & : 96 \text{ cm}^3
\end{align*}
\]

12 A cheap carbon monoxide detector for a gas heater consists of a patch containing palladium chloride crystals. When carbon monoxide is present, the crystals turn from orange to black as the following reaction takes place.

\[
\text{CO} (g) + \text{PdCl}_2 (s) + \text{H}_2\text{O} (l) \rightarrow \text{CO}_2 (g) + \text{Pd} (s) + 2\text{HCl} (aq)
\]

Which is the element whose oxidation number decreases in this reaction?

A carbon  B chloroide  C hydrogen  D palladium

13 Which of the following is an example of a redox reaction?

A \( \text{Na}_2\text{CO}_3 + 2\text{HCl} \rightarrow 2\text{NaCl} + \text{H}_2\text{O} + \text{CO}_2 \)
B \( \text{Mg} + 2\text{HCl} \rightarrow \text{MgCl}_2 + \text{H}_2 \)
C \( \text{ZnO} + 2\text{NaOH} \rightarrow \text{Zn(OH)}_2 + 2\text{NaCl} \)
D \( \text{CaO} + \text{SiO}_2 \rightarrow \text{CaSiO}_3 \)

14 In an acid-base titration, a 0.10 mol dm\(^{-3}\) solution of a base is added to 20 cm\(^3\) of a 0.10 mol dm\(^{-3}\) solution of an acid. The pH value of the solution is plotted against the volume of base, \( V \), added as shown in the diagram.

This diagram could represent a titration between

A \( \text{CH}_3\text{COOH (aq) and NH}_3\text{aq} \)
B \( \text{CH}_3\text{COOH(aq) and KOH (aq)} \)
C \( \text{H}_2\text{O} (aq) and \text{KOH (aq)} \)
D \( \text{H}_2\text{O} (aq) and \text{NH}_3\text{(aq)} \)

15 The table below refers to four metals and some of their compounds.

17 Solid X has the following properties

I It is soluble in water
II When warmed with sodium hydroxide solution, a gas is given off.
III It gives off a gas when added to dilute sulfuric acid

Which of the following is X?

A ammonium carbonate  B sodium nitrate
C calcium chloride  D magnesium sulfate

18 Many properties of an element and its compounds can be predicted from the position of the element in the Periodic Table. What property could not be predicted in this way?

A the acidic or basic nature of its oxide
B the formula of its oxide
C the number of isotopes it has
D its metal or non-metallic properties
19 Which of the following statements are true about the elements in Group I of the Periodic Table?
1. They are reducing agents
2. The ionic radius increases down the group
3. Their reactivities decrease on descending down the group
A 1, 2 and 3   B 1 and 2 only
C 2 and 3 only  D 1 only

20 In an experiment 4.0 cm$^3$ of 1.0 mol/dm$^3$ of copper(II) sulfate solution are mixed with 8.0 cm$^3$ of 1.0 mol/dm$^3$ potassium carbonate solution.

What does the reaction vessel now contain?
A a green precipitate and a blue solution
B a colourless solution only
C a white precipitate and a colourless solution
D a green precipitate and a colourless solution

21 Approximately 40% of all iron and steel is produced by recycling. Which statements are correct reasons for recycling iron?
1. Iron, when obtained by a recycling process produces less carbon dioxide than the blast furnace process
2. Scrap steel contains a higher percentage of iron than iron ore
3. Scrap metal, if not recycled, would cause environmental problems due to disposal by landfill
A 1, 2 and 3   B 1 and 2 only
C 1 and 3 only  D 2 and 3 only

22 Which reaction is not a step in the production of iron from haematite in the blast furnace?
A Carbon burning in air to produce carbon dioxide
B Carbon reacting with carbon dioxide to produce carbon monoxide
C Iron (III) oxide reacting with carbon monoxide to form iron
D Iron reacting with limestone to produce slag

23 The reaction in the Haber process is represented as

$$N_2(g) + 3H_2(g) \rightleftharpoons 2NH_3(g) \quad \Delta H = -92 \text{ kJ}$$

Which of the following statements about the Haber process is incorrect?
A 92 kJ of heat is given off when 2 mol of ammonia are formed
B An iron catalyst has the same effect on both forward and backward reaction
C The process is carried out at a high pressure of 250 atmospheres
D When 2 mol of $N_2$ and 6 mol of $H_2$ are used, 4 mol of $NH_3$ are collected

24 In the conversion of compound P into compound R, it was found that the reaction proceeded by way of compound Q. The following graph shows the energy profile diagram for the reactions:

What can be deduced from the diagram?

- step 1: P $\rightarrow$ Q
- step 2: Q $\rightarrow$ R

A Both steps are endothermic
B The overall reaction to convert P to R is exothermic
C Step 2 involves breaking of stronger bonds than step 1 because Q is at higher energy level.
D Step 1 is harder to take place than step 2 because more energy is needed for bond breaking
25 Dilute hydrochloric acid reacts with an aqueous solution of sodium thiosulfate, Na₂S₂O₃, according to the chemical equation below:

\[ \text{Na}_2\text{S}_2\text{O}_3(aq) + 2\text{HCl}(aq) \rightarrow 2\text{NaCl}(aq) + \text{H}_2\text{O}(l) + \text{S} + \text{SO}_2(g) \]

10.0 cm³ portions of 2.00 mol/dm³ dilute hydrochloric acid were added to four separate conical flasks. Each flask contains 90.0 cm³ sodium thiosulfate solution which was prepared by dilution with different volumes of water as shown in the table.

<table>

27 To reduce atmospheric pollution, the following waste gases from a coal burning power station are passed through wet powdered calcium carbonate:

How many waste gases will not be removed by the wet powdered calcium carbonate?

- carbon monoxide
- carbon dioxide
- nitrogen monoxide
- nitrogen dioxide
- sulfur dioxide
- phosphorus(V) oxide

A 1  B 2  C 3  D 4

28 In the past, CFC (chlorofluorocarbon eg CF₂CH₂Cl) compounds were used as aerosol propellants. Which element in the compound can cause a depletion of ozone?

A carbon  B fluoride  C chlorine  D hydrogen

29 Element X is extracted by the electrolysis of a molten compound of elements X and Y. The electrode reactions are shown below:

\[ \text{cathode: } X^{2+} + 2e^- \rightarrow X \]
30 Three electrolytic cells are set up with inert electrodes. The electrolytes used are listed below:
- cell 1: concentrated aqueous rubidium chloride
- cell 2: dilute nitric acid
- cell 3: molten zinc bromide

In which of these cell(s) is/are gases formed at both electrodes?
A. 2 only
B. 3 only
C. 1 and 2 only
D. 1 and 3 only

31 In the electrolysis of molten aluminium oxide, 4 moles of aluminium ions (Al^{3+}) were discharged at the cathode.
Which one of the following would be discharged by the same amount of electricity?
A. 4 moles copper (II) ions (Cu^{2+}) in the electrolysis of aqueous copper (II) sulfate
B. 6 moles of lead ions (Pb^{2+}) in the electrolysis of molten lead (II) bromide
C. 6 moles of silver ions (Ag^{+}) in the electrolysis of aqueous silver nitrate
D. 12 moles of zinc ions (Zn^{2+}) in the electrolysis of molten zinc sulfate

32 Four metals tin, x, y, and z were connected in pairs and the voltages were recorded.

The results obtained are shown in the table below:

<table>
<thead>
<tr>
<th>Metal</th>

35 Which ester contains five carbon atoms in one molecule of the ester?
A. butyl propanoate
B. ethyl ethanoate
C. ethyl propanoate
35 The diagram shows the structural formula of chloromalte acid

\[
\text{HO} \quad \text{Cl} \quad \text{OH} \\
\text{C} \quad \text{C} \quad \text{C} \quad \text{OH} \quad \text{C} \quad \text{O}
\]

Which of the following statements is incorrect?

A chloromalte acid
A will turn acidified potassium dichromate (VI) from orange to green
B decolours aqueous bromine rapidly
C can undergo addition polymerisation
D will react with zinc carbonate to produce a gas

37 Which statement about fractional distillation of petroleum is correct?

A At each level in the column, only one compound is collected
B The higher up the column, the greater the temperature
C The molecules collected at the bottom of the column are the most flammable
D The molecules reaching the top of the column have the smallest relative molecular mass

38 The formulae of four covalent molecules are shown:

1. \( \text{CO}_2 \)
2. \( \text{H}_2\text{O} \)
3. \( \text{C}_2\text{H}_6\text{OH} \)
4. \( \text{C}_9\text{H}_8\text{COOH} \)

In which pair of molecules does oxygen atom form at least one double bond in both molecules?

A 1 and 2
B 1 and 4
C 2 and 3
D 3 and 4

39 The diagram below shows how pure titanium can be used to catalyse the reduction of unsaturated oils to saturated fats. Squalene is naturally occurring unsaturated oil present in sharks.

A 0.100 mol sample of squalene reacted with 14.4 dm\(^3\) of hydrogen at room temperature and pressure to form a saturated hydrocarbon \( \text{C}_{29}\text{H}_{58} \).

What is the molecular formula of squalene?

A \( \text{C}_{29}\text{H}_{56} \)
B \( \text{C}_{29}\text{H}_{62} \)

CHEMISTRY

Paper 2 Theory
Secondary 4 Express

Set by: Mrs Elizabeth Lim
Vetted by: Ms Ong Lay Hong and Mr Ong Kai Kun

READ THESE INSTRUCTIONS FIRST

Write your name, index number and class in the spaces at the top of this page and on all separate answer paper used.
Write in dark blue or black pen.
You may use a pencil for any diagrams, graphs or rough working.
Do not use staples, paper clips, highlighters, glue or correction fluid.

Section A
Answer all questions.
Write your answers in the spaces provided on the question paper.

Section B
Answer all three questions, the last question is in the form either/or.
Answer all questions in the spaces provided.

You are advised to spend no longer than one hour on Section A and no longer than 45 minutes on Section B.
At the end of the examination, fasten all your work securely together.
The number of marks is given in brackets [ ] at the end of each question or part question.
All essential working must be shown clearly.
A copy of the Periodic Table is printed on page 21.
Section A

Answer all the questions in this section in the spaces provided.
The total mark for this section is 50.

A1 Table 1.1 shows information about six substances

<table>
<thead>
<tr>

Use the letters A, B, C, D, E, F and G to answer the following questions:

(a) Which substance, whose solution when added to the solid G, produces an effervescence?

........................................................................................................................................ [1]

(b) Which substance, whose solution, when added to aluminum nitrate solution produces a precipitate soluble in excess?

........................................................................................................................................ [1]

(c) Which substance can be found in fizzy drinks?

........................................................................................................................................ [1]

(d) Which two substances when reacted together produced a fertilizer that is used in the agriculture industry?

........................................................................................................................................ [1]

(e) Which substance is formed when there is incomplete combustion of fuel?

........................................................................................................................................ [1]
Rock salt (NaCl) is an ionic compound that occurs naturally as white crystals. It is extracted from the mineral form halite or evaporation of seawater. The flowchart outlines the steps used to determine the percentage of sodium chloride present in a sample of rock salt of mass 2.5 g.

(a) Give the ionic equation for the formation of the precipitate formed in Step 2.

(b) Explain what precautions must be taken in steps 2 and 3 to ensure accuracy of results.
(c) At the end of the experiment the mass of the precipitate was found to be 5.74 g. Calculate the percentage of sodium chloride in the rock salt sample.

(d) Suggest another test to show that the rock salt is impure.

---

A3 A student performed three experiments using the metals iron, manganese and chromium.
In the first experiment he added the metals separately into dilute sulfuric acid.
In the second experiment he heated the metals in air and in the last experiment he put strips of the metals in metal salt solutions.

Table 3.1 below shows the results of the first two experiments.

<table>
<thead>
<tr>
<th>metal</th>
<th>reaction with sulfuric acid</th>
<th>reaction with air</th>

<td>metal dissolves quickly with effervescence, a pale pink solution, manganese (II) sulfate, is formed</td>
<td>burns in air with an intense white light forming a red solid, manganese(II,III) oxide, Mn₃O₄</td>
</tr>
<tr>
<td>chromium</td>
<td>metal dissolves readily with effervescence, a violet solution, chromium (III) sulfate, is formed</td>
<td>burns in air to form green chromium(III) oxide, Cr₂O₃</td>
</tr>
</tbody>
</table>

---

[Turn over]
(a) From the information above, state two properties of iron, manganese and chromium that show them to be transition metals.

(b) Write a balanced equation for the reaction of manganese with dilute sulfuric acid

(c) Figure 3.1 below shows strips of manganese and chromium in iron(II) sulfate and manganese(II) sulfate solutions.

![Diagram of experiments](image)

Fig 3.1

State the observations you would expect in Table 3.2 below.

<table>
<thead>
<tr>
<th>experiment I</th>
<th>experiment II</th>
<th>experiment III</th>

[3]
(d) Decomposition temperature of a substance is the temperature at which the substance chemically decomposed. Carbonate of iron, manganese and chromium decompose to give the metal oxide and carbon dioxide.

\[ \text{MCO}_3 \rightarrow \text{MO} + \text{CO}_2 \]

(i) Explain which of the three carbonates has a higher decomposition temperature?

(ii) When 2.3 g of a metal carbonate is decomposed completely by heating, 480 cm³ of carbon dioxide is produced at room temperature and pressure. Calculate the relative formula mass of the metal carbonate and hence identify the metal.
Figure 4.1 represents the electrolysis of aqueous silver nitrate using graphite electrodes.

![Diagram of electrolysis](image)

**Fig 4.1**

(a) (i) What would you observe at each electrode and write the ionic half equation for the reaction that occurred at each electrode

**Electrode X**

observation: .......................................................... ..

ionic equation: ..........................................................

(ii) Explain what happened to the electrolyte after some time.

..............................................................................

..............................................................................

..............................................................................

.............................................................................. [2]

(b) Rust and corrosion are costing the industry billions of dollars a year. In fact, rust has almost become part of our everyday life - with many industries resigned to accepting rust as being inevitable and costly.

(i) Write the ionic half equation when iron rust.

..............................................................................

[Turn over]
(ii) Figure 4.2 illustrates one method of protecting an underground steel pipe.

Fig 4.2

1. Indicate on the diagram the flow of electrons. 

2. Explain how this method works. 

(iii) Suggest an alternative way the underground pipe can be protected.

With the help of ionic half equation, explain your answer.
Fossil fuels are a major source of energy. To generate electricity, heat produced by the burning of liquefied petroleum gas (LPG) is used to convert water to steam which then drives a turbine that generates electricity. LPG contains mainly propane. The equation for the combustion of propane is shown below.

$$C_3H_8 (g) + 5O_2 (g) \rightarrow 3CO_2 (g) + 4H_2O (g) \quad \Delta H = -2220 \text{ kJ/mol}$$

(a) Draw an energy profile diagram for the combustion of propane.
   Your diagram should show and label:
   - reactants and products,
   - the activation energy for the reaction,
   - the enthalpy change of the reaction.

(b) Sketch on the energy profile diagram you have drawn in (a) for the burning of liquid propane.

(c) A propane – oxygen fuel cell uses oxygen and propane to produce electricity. The followings are the two half equations for the reactions.

   Equation 1: \( C_3H_8(g) + 6H_2O (l) \rightarrow 3CO_2(g) + 20H^+(aq) + 20e^- \)

   Equation 2: \( 5O_2(g) + 20H^+(aq) + 20e^- \rightarrow 10 H_2O(l) \)

   (i) Which reaction takes place at the anode and which at the cathode?

   anode: ........................................

   cathode: ........................................

(ii) What is the overall equation for the propane – oxygen fuel cell?
(iii) Suggest with reasons which is a more efficient way of producing electricity, propane - oxygen fuel cell or the burning of LPG to drive the turbine in the generator.

(d) Liquefied petroleum gas (LPG) and paraffin (kerosene) are used as household fuel. Paraffin is safer than LPG. Suggest a reason why.

A6 (a) Group IV elements show a trend from non-metallic to metallic behaviour with increasing atomic number. This is shown by the acid base properties of carbon dioxide, silicon dioxide and lead(II) oxide.

<table>
<thead>
<tr>
<th>group IV elements</th>
<th>formula of oxide</th>
<th>acidic / basic / amphoteric</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td>CO₂</td>
<td></td>
</tr>
<tr>
<td>Si</td>
<td>SiO₂</td>
<td></td>
</tr>
<tr>
<td>Pb</td>
<td>PbO</td>
<td></td>
</tr>
</tbody>
</table>

(i) Complete the table by filling in the empty boxes.

(ii) Support your answer with equations where possible to explain the acidic, basic or amphoteric behaviour of CO₂, SiO₂ and PbO.
(b) PbO and PbO₂ differ strikingly in their properties. Both oxides react with acid as given in the equations below.

\[
\text{equation 1: } \text{PbO} + 2\text{HCl} \rightarrow \text{PbCl}_2 + 2\text{H}_2\text{O}
\]

\[
\text{equation 2: } \text{PbO}_2 + 4\text{HCl} \rightarrow \text{PbCl}_2 + \text{Cl}_2 + 2\text{H}_2\text{O}
\]

What is the role of lead oxide in each of the reaction with hydrochloric acid? Explain your answer.

PbO:

__________________________________________________________________________

__________________________________________________________________________

__________________________________________________________________________ [1]

PbO₂:

__________________________________________________________________________

__________________________________________________________________________

__________________________________________________________________________

__________________________________________________________________________ [2]
Section B

Answer three questions from this section. The last question is in the form of an either/or and only one of the alternatives should be attempted.

B7. (a) The ionization energy of an atom describes the minimum amount of energy required to remove an electron (to infinity) from an atom. The data below shows a plot of ionisation energy against the number of the electron removed for sodium.

![Graph showing ionisation energy against number of electron removed](Image)

Fig 7.1

Use the information above to explain the trend in ionisation energy for sodium with reference to its electronic structure.

________________________________________________________________________________________________________

________________________________________________________________________________________________________

________________________________________________________________________________________________________

________________________________________________________________________________________________________

________________________________________________________________________________________________________

________________________________________________________________________________________________________

________________________________________________________________________________________________________

[3]
(b) Table 7.1 shows the first ionization energy (energy required to remove the first electron from the atom) of elements in Period 3.

<table>
<thead>

</table>

(i) Complete the table by filling in the formulae of the hydrides. [1]

(ii) Explain why there is a great difference in the first ionization energy of sodium and argon. [2]

(iii) Draw a 'dot and cross' diagram to show the bonding in sodium hydride. You need to show all the electrons. [2]

(iv) Suggest one similarity and one difference in physical property between sodium hydride and hydrogen chloride.

similarity: .................................................................

.................................................................

difference: ................................................................. [2]

.................................................................
A student carried out an experiment to investigate the relationship between the mass of zinc used in a reaction and the volume hydrogen gas liberated. In the experiment he added pieces of zinc to 50 cm³ of hydrochloric acid and recorded the volume of the gas collected. Table 3.1 shows the student's results.

<table>
<thead>
<tr>

The reaction of zinc and hydrochloric acid is

\[ \text{Zn} \quad + \quad 2\text{HCl} \quad \rightarrow \quad \text{ZnCl}_2 \quad + \quad \text{H}_2 \]

(a) (i) Calculate the volume of hydrogen liberated when 0.5 g of zinc was used.

(ii) Using information from Table 3.1 suggest why the answer in (i) is different from the one obtained in the experiment.

(b) Suggest why the volume of the hydrogen collected is different for 0.1 g to 0.6 g of zinc but remains the same for 0.7 g and 0.8 g.
(c) Using information from the Table 3.1 calculate the concentration of the acid used in this experiment.

(d) The experiment was repeated using hydrochloric acid which was warmed to 60°C. Using the collision theory explain why a shorter time was observed to collect the hydrogen gas.
Either

B9 (a) Ethanol can be manufactured by two processes. The flowcharts outline the sequence of steps for producing ethanol

- Process 1

  petroleum
  \[\text{Step 1 fractional distillation}\]
  petroleum fractions
  \[\text{step 2}\]
  ethene
  \[\text{step 3}\]
  ethanol

- Process 2

  glucose
  \[\text{fermentation}\]
  ethanol

(i) Name the process in step 2

(ii) State the conditions for step 3.

(iii) Briefly explain which process 1 or 2 is sustainable in the production of ethanol in the industry

(iv) Suggest two reasons to show that Process 2 is more environmentally friendly than Process 1.
(b) (i) Ethyl ethanoate, a sweet smelling compound, has many uses. It can be used in perfumes or as flavouring.
Outline with the help of condensed or full structural formula equations, how a sample of ethyl ethanoate can be prepared in the laboratory. You can only use ethanol as the starting material. Other inorganic reagents where appropriate can be used in the preparation.

(ii) Draw the full structural formula of an isomer of ethyl ethanoate which belongs to the same homologous series.
Today, a significant number of personal care products such as scrubs and toothpastes are known to contain thousands of minuscule balls of plastic called microplastics, or more specifically, microbeads. Over the years, microbeads have replaced traditional, alternatives such as ground nut shells, and salt crystals.

The microbeads used in personal care products are almost always smaller than 1 mm, the width of a pencil tip. They are mainly made of polyethene (PE), but can also be made of polypropene (PP), polyethylene terephthalate (PET), polymethyl methacrylate (PMMA) and nylon.

Microbeads are washed down the drain after use and flow through sewer systems around the world before making their way into rivers and canals and ultimately, straight into the seas and oceans. Now, fish have a gut full of them. Researchers around the world have detected them in marine mussels and shore crabs. Their synthetic molecules bind to chemicals to become "a pathway for pollutants to enter the food chain".

(a) Draw the full structural formula of polypropene showing two repeat units.

(b) Polyethylene terephthalate (PET) is made from two monomers, terephthalic acid and ethane-1,2-diol (HO CH₂CH₂OH).
The structural formula of terephthalic acid is:

\[
\begin{align*}
\text{H} & \quad \bigg/ \quad \text{C} \quad \bigg/ \quad \text{O} \\
\text{O} & \quad \bigg/ \quad \text{C} \quad \bigg/ \quad \text{O} \\
\text{H} & \quad \bigg/ \quad \text{H}
\end{align*}
\]

Draw the repeat unit of PET.
(c) Methyl methacrylate (MMA) is an organic compound with the formula CH$_2$=C(CH$_3$)COOCH$_3$ This colourless liquid, (MMA), is the methyl ester of methacrylic acid. MMA is a monomer produced on a large scale for the production of polymethyl methacrylate (PMMA).

(i) Draw the full structural formula of methacrylic acid. [1]

(ii) Draw the structure of polymethyl methacrylate (PMMA) showing two repeat units. [1]

(iii) The common name for polymethyl methacrylate (PMMA) is perspex and has the appearance of glass. It is used in aeroplane windows. Suggest one advantage of perspex over the use of glass. [1]

(d) (i) Microbeads are cheap. Give one reason why they might become expensive in the future. [1]

(ii) Suggest a reason why the traditional use of ground nut shells is better than the use of microbeads. [1]
(e) Polypropene can be disposed of by combustion.

(i) Using its empirical formula construct an equation for the complete combustion of polypropene.

(ii) Calculate the volume of carbon dioxide produced when 1 tonne of polypropene is burned.

Key:
- * = atomic mass
- a = atomic number
- b = proton (atomic) number

The volume of one mole of any gas is 24 dm³ at room temperature and pressure (1 atm).
A1 (a) A or B

(b) F

(c) B

(d) A / B and C

(e) D

A2 (a) Ag⁺(aq) + Cl⁻(aq) → AgCl (s)

(b) In step 2 there must be excess of silver nitrate solution and nitric acid to ensure all chloride ions are precipitated.
In step 3 the precipitate must be dried and weighed a number of time until a constant weight is obtained to ensure all water has evaporated from silver chloride.

(c) Moles of AgCl = \[ \frac{2.74}{143.5} \] = 0.04
Mass of NaCl = 0.04 \times 58.5 = 2.34 g
% of NaCl = \[ \frac{2.34}{25} \] = 93.6

(d) Carry out chromatography on the rock sample. If there is one spot it is pure. More than one spot it is impure.
Or check the melting point of the rock sample. If it melts at a fixed temperature it is pure. If it melts over a range of temperature it is impure.

A3 (a) They form coloured compounds.
They have variable oxidation states.

(b) MnO₂ + H₂SO₄ → MnSO₄ + H₂O

(c) Experiment I: pale green solution turns pale pink; a grey deposit is formed.
Experiment II: pale green solution turns violet; a grey deposit is formed; no reaction.

(d) (i) MnO₂ has the highest decomposition temperature.
Mn is the most reactive metal among the three metals; its compounds are the most stable and need more energy to decompose.

(ii) Moles of CO₂ = \[ \frac{480}{24000} \] = 0.02

A4 (a) (i) Electrode X: effervescence
4OH⁻(aq) → 2H₂O(l) + O₂(g) + 4e⁻

Electrode Y: a silvery grey deposit
Ag⁺(aq) + e⁻ → Ag(s)

(ii) AgNO₃ solution slowly turns into acidic HNO₃ solution as OH⁻ ions are being discharged from the solution leaving behind H⁺ ions.

(b) (i) Fe → Fe²⁺ + 2e⁻

(ii) 1. The electrons from the power source (c) travel to the steel pipe.
2. Excess electrons on the steel pipe prevents the oxidation of iron.
3. Attached to a block of Mg to the steel pipe.
Mg being more reactive than iron will corrode instead of iron.
Mg → Mg²⁺ + 2e⁻

A5 (a) Correct diagram with labelling.

(c) (i) Anode Equation 1: \[ \text{C}_2\text{H}_6(g) \rightarrow 2\text{CO}(g) + 3\text{H}_2(g) \]

(ii) \[ \text{C}_2\text{H}_6(g) + 5\text{O}_2(g) \rightarrow 2\text{CO}_2(g) + 3\text{H}_2\text{O}(g) \]

(iii) Fuel cell is a more efficient way. Using the generator a lot of heat is lost to the surroundings when fuel is burnt to generate steam to turn the turbine.

(d) Paraffin is safer to use as it is a liquid and has a higher boiling point and is not as flammable as LPG.

A6 (a) (i) CO₂ - acidic, SiO₂ - acidic, P₂O₅ - amphoteric.
(ii) CO₂ is acidic dissolves in water to form H₂CO₃.
SiO₂ is acidic, it reacts with CaO (a base) to form a salt, calcium silicate
\[ \text{SiO}_2 + \text{CaO} \rightarrow \text{CaSiO}_3 \]
PbO is amphoteric it reacts with acid to form a salt and water
\[ \text{PbO} + 2\text{HCl} \rightarrow \text{PbCl}_2 + \text{H}_2\text{O} \]
PbO reacts with NaOH to from a salt, sodium plumbate, and water

(b) Equation 1 PbO is acting as a base
It reacts with acid to form salt and water
\[ \text{PbO}_2 \text{oxidises Cl⁻ in HCl to Cl}_2 \text{. There is an increase in oxidation state of chlorine from -1 to 0} \]

Equation 2 PbO₂ is an oxidising agent.
\[ \text{PbO}_2 \text{oxidises Cl⁻ in HCl to Cl}_2 \]

B7 (a) The first ionisation energy is removing one electron from the third shell which is furthest away from the nucleus hence lowest energy required.
There is only a slight increase from the 2⁰ to 3⁰ ionisation energy as this involves the removal of 8 electrons from the same second shell.
1⁰ and 1¹ ionisation energy are highest as it involves removal from the first shell closest to the nucleus.

(b) (i) First ionisation energy of Na and Ar both involves removal of one electron from the third shell.
However, the completely-filled shell of Ar has extra stability. It is more difficult to remove electron from this stable configuration and hence the ionisation energy is very high.

(ii) Sodium hydride

(iii) Formula of the hydride of the element

<table>
<thead>
<tr>
<th>Element</th>
<th>SiH₄</th>
<th>PH₃</th>
</tr>
</thead>
</table>

If all correct [1]

(iv) Similarity: NaH and HCl are both soluble in water.
Difference: NaH has high melting point and boiling point.
HCl has low melting and boiling point.

B8 (a) (i) Moles of 0.5 g of zinc = \[ \frac{0.5}{65} = 0.007692 \]
Moles of H₂ = 0.007692 \times 24000
Volume of H₂ = 184.6 cm²

(b) The zinc samples are impure

(b) In the experiments when 0.1 g to 0.6 g of zinc was used, zinc is the limiting reagent.
In excess of 0.7 g of zinc, HCl is the limiting reagent.

(c) Moles of H₂ = \[ \frac{225}{24000} = 0.009375 \]
Moles of HCl = 0.009375 \times 2
= 0.01875

Concentration of HCl = \[ \frac{1000}{30} \times 0.01875 \]
= 0.375 mol/dm³

(d) At a higher temperature the particles gain energy and move faster.
There are more particles that possess the minimum activation energy hence increase in effective collisions, increase in rate of reaction.

Either B9 (a) (i) cracking

(b) (i) Ethanol is oxidized to ethanoic acid using oxidized K₂Cr₂O₇ or KMnO₄ and heat
\[ \text{CH}_3\text{CH}_2\text{OH} + \text{O}_2 \rightarrow \text{CH}_3\text{COOH} + \text{H}_2\text{O} \]

Ethanol is then heated with ethanol and in the presence of concentrated H₂SO₄ to produce ethyl ethanoate
\[ \text{CH}_3\text{COOH} + \text{CH}_3\text{CH}_2\text{OH} \rightarrow \text{CH}_3\text{COOCH}_2\text{CH}_3 + \text{H}_2\text{O} \]

(c) \[ \text{H}_2\text{O} \]

Or

B9 (a) (i) \[ \text{CH}_3\text{H} \]

(ii) \[ \text{CH}_2\text{H} \]

(iii) \[ \text{C}-\text{O}-\text{C}-\text{C}-\text{H} \]

(iv) \[ \text{H}-\text{C}-\text{C}-\text{C}-\text{H} \]

(v) \[ \text{H}-\text{C}-\text{C}-\text{C}-\text{H} \]

Or

B9 (a) (i) \[ \text{CH}_3\text{H} \]

(ii) \[ \text{CH}_2\text{H} \]

(iii) \[ \text{C}-\text{O}-\text{C}-\text{C}-\text{H} \]

(iv) \[ \text{H}-\text{C}-\text{C}-\text{C}-\text{H} \]

(v) \[ \text{H}-\text{C}-\text{C}-\text{C}-\text{H} \]
(c) (i) O
H
C - O - H
H
C - C - H
H
H

(ii) Perspex does not break as easily as glass. Perspex when shattered does not injure as seriously as glass.

(d) (i) The raw material of microbeads is crude oil and in future, oil will be very expensive as it is running low.
(ii) Ground nut shells occur naturally hence it is biodegradable and environmentally friendly.

(e) (i) \[ 2\text{CH}_2 + 3\text{O}_2 \rightarrow 2\text{CO}_2 + 2\text{H}_2\text{O} \]
(ii) 1 tonne \(\text{CH}_2 = \frac{1}{14} \times 10^8\) moles
Moles of \(\text{CO}_2 = 0.07142 \times 10^8\)
Volume of \(\text{CO}_2 = 0.07142 \times 10^8 \times 24 \text{ dm}^3 = 1.71 \times 10^5 \text{ dm}^3\)

OR \[ 2\text{C}_2\text{H}_4 + 3\text{O}_2 \rightarrow 6\text{CO}_2 + 6\text{H}_2\text{O} \]
1 tonne \(\text{C}_2\text{H}_4 = \frac{1}{42} \times 10^8\) moles
\[ = 0.023809 \times 10^8\]
Moles of \(\text{CO}_2 = 0.023809 \times 10^8 \times 3\)
Volume of \(\text{CO}_2 = 0.07142 \times 10^8 \times 24 \text{ dm}^3 = 1.71 \times 10^5 \text{ dm}^3\)
